4153. 850sat : problem with M.ch/Vfo.ch knob

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-02 15:05:10 UTC
From: Allan
Topic: 4153 Message: 4153

Hi all,

On my 850sat, the M.ch/Vfo.ch knob don't work good. Sometimes frequency change, sometimes not.
I clean it with special connection spray-can but that don't stop the problem.

Which sort of potentiometer can I use for remplace it ?

Many thanks for your help,

Happy new year at all,

Regards

Allan

4154. Re: [TS-850_450_690] 850sat : problem with M.ch/Vfo.ch knob

From: Zack Widup
Topic: 4153 Message: 4154

It is a digital encoder. I'd recommend replacing it with the original part, Kenwood part number W02-1660-05 I believe. (Let me double-check that.)

4155. TS-850SAT doesn't return to RECEIVE

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-02 18:09:07 UTC
From: Jose V. Gavila
Topic: 4155 Message: 4155

Happy 2006 to all of you!

Well, I am having some troubles with a TS-850S and wonder it it is a common fault and/or you can give me some advice... When it is about 30 minutes powered, most of the times after transmitting it does not receive. It stops transmitting but there is no audio coming from the speaker. Pressing PTT again sometimes gets back reception.

Any clue?

Thanks and best regards,

JOSE

Topic: 4144 Message: 4156

Squeaky gears. Get a Teflon spray lubricant at Lowe's or equiv. and spray behind the plastic gears that are practically touching the tuner's case. You will have to lift the tuner out of the rig to remove more covers to get to the gears, sort of. Use the supplied straw to apply. Don't lose the screws and don't use WD-40. -- Charlie K6HTM

From: Frank
Topic: 4144 Message: 4157

Hi
Yes thats the problem I had with my TS-850 but after some spraying it´s fine now.
But another question comes to mind.. I did remove the 2 pots in order to get access to the plastic gears. Thats all fine and they needed some cleaning too , after putting it together again it seems to work Ok in auto and manual mode ,but maybe the pots should be installed in a certain position with respect to the capacitor gearing. example ..min capacitor pos should
be at min pot-resistance pos..or something.
I guess the pots are encoders for the CPU.
Anyone knows if there is a specific procedure for reinstalling the pots ?

Thanks
Frank

Topic: 4158 Message: 4159

Hi, Bruce. I'm trying to remember what I saw when I was working on my 450 tuner earlier this year. I think that the tuner re-tuned about every 3 MHz at the lower frequencies, moving to wider spacing as you tuned up the bands. I believe that the tuner range is continuous, and that it will try to tune any signal you give it. The band switch input is just used for a starting point, I think.

Regards,
Ed

I think the tuning range depends on the band. It will not have to retune as often on the higher bands as the swr bandwidths are generally wider as you go up in freuency. On 80m for example if I tune my dipole to 3.740, the tuner will automatically retune if I tune the VFO below 3.600, whereas I can tune through the entire 10m band without so much as a squeak. The tuner in my 850 has tuned anything I have thrown at it.

4162. ACC2 PLUG

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-06 02:03:15 UTC
From: Russell Blair
Topic: 4162 Message: 4162

Now that I have the ACC2 plugs, and looking in the book to connect up the sound card to the plug it looks like for (AFSK) from the sound card output is on pins 3&4 labled as (AF INPUT)and the rec audio to the radio labled (Moduration output)is on pins 11&12.
Oh my radio is a TS-450S, Now do I still need the 100:1 pad from the sound card output to the input to the radio as needed when I was using the mic as the radio input. Can any one tell if this wright or do I have all this backwords. It kinda hard to tell from the drawing in the book because all of the arrows point out from the radio.

From: max_ve3tmt
Topic: 4162 Message: 4163

Russell,

Connect your sound card output to pins 11 (MOD) and 12 (GND).

Connect your sound card input to pins 3 (ANO) and 4 (GND).

There are 2 PTT pins. If you ground pin 13 it keys the radio, but the mic input on the front is still hot, causing any noises picked up while transmitting will also be heard. If you ground pin 9, it keys the rig but mutes the mic audio line front the mic jack.

The input stages are almost identical so I would keep the input attenuation the same. Any slight level differences can be taken care of with the level controls on your sound card software. If you develop feedback or RF on your signal you may need to use an isolation transformer in the TX audio line, the one coming from your sound card output. This is where a RigBlaster makes the job easy.

Good luck, if you have any questions, e-mail off the board, max_ve3tmt@...

4164. 850 Output Problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-06 18:24:07 UTC
From: Daniel Hileman
Topic: 4164 Message: 4164

Hi Everyone,

I have a Kenwood TS-850SAT, which I LOVE!!! The issue I am having is that when I start to transmit, the power goes from the normal 100watt output down to nothing on the output. If I stayed keyed up, usually the power comes back up and operates fine...sometimes it does the same thing. I have checked all connections, they seem fine. There is NO SWR issue cuz I have been watching it. I thought maybe it draws a certain amount of current and the PS folds, but I dont know. The PS seems to run my other 100watt rig fine. I dont think it's RF gettting into the rig but anything is possible. I need to take it out to the truck and put it on a battery and see if that solves the problem but it's been too cold, hi hi. Anyone have this problem before? Anyone have suggestions?

Thanks and 73,
Daniel Hileman N9WX

Dan,

What range of power flucuation are you experiencing? There is a fix
for the dc-dc converter board which fixes this problem on a small scale.

4166. Re: 850 Output Problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-07 00:21:35 UTC
From: Richard Ferch
Topic: 4164 Message: 4166

My 850 had a less severe version of this problem. Every few seconds the ALC voltage would suddenly spike up and then recover. The radio's power output dropped in sunc with the ALC spike.

I fixed it by tacking a 47K 1/8 watt resistor across each of R2 and R3 on the DC-to-DC board (X59-1100-00) which is a very small (about 1 cm x 3 cm) board that stands vertically near the inner end of the B/4 RF board that is visible from above the radio with the top off, near the front left corner of the radio. You have to unplug three connectors from the B/4 board, then remove the 4 screws and carefully slide the board out the left side of the radio, out from under all the cable harnesses and ribbon cable. Once the B/4 board is removed, you should be able to get access to the front of the DC-to-DC board without removing it from the B/4 board.

Actually, instead of tacking the resistors directly across R2 and R3, what I did was tack one end of one resistor to the bottom end of R2, and one end of the other resistor to the right end of R3. I then tacked the free ends of both resistors to the top end of R1, at the top left corner of the DC-to-DC board. An ohmmeter across each 47K resistor now reads 15K, verifying that they are indeed parallel with the 22K resistors on the board. I found an extra pair of hands very helpful - luckily my daughter was at home and willing to help!

This mod seems to have cured the fluctuation problem so far.

You can read more about the problem at http://www.qsl.net/k0bx/ (click on TS-850 ALC/TX Problem) and at http://n6tr.jzap.com/850repair.html (look down the page for ALC Voltage Problem).

I was using the mfj 1275 (sitting on shelf now), but picked up another style currently in use (might be a rascal, but not sure), anyway I will NOT use a rigblaster. Already blew one computer from overdriving the audio with no transformer isolation.. which the mfj and the brand x I am currently using both have. The rigblaster only had isolating on the mic audio side...

The only diadvantage was that the mfj did not allow for speakers to run WHILE operating......at least not that I found

my interface is wired to the 13 pin accessory jacks on the rear of both my 850 and 790 Kenwoods, and I flip a switch to go between them.

Dave,

I am confused by your statement. How do you blow a computer from overdriving the audio? I agree the RigBlaster only uses an isolation transformer on the TX side, which is really all you need. Any introduction of hum or ground loops on the receive side would be a result of something not wired properly in the shack. At the very most the rigblaster will only put into your computer what comes in from the radio. We are talking very low audio levels and at the most I would think your sound card would suffer the damage and I can't even see that happening. I have overdrven my sound cards many times while setting up the rigblaster and never had one big of trouble. I have also run the sound card straight to and from the 850 without any isolation whatsoever and never had issues. In fact I would consider my RigBlaster Plus to be one of the best additions I've made to the shack in a long time, and I always get unsolicited reports on the quality of my PSK signal. Can you elaborate more on the computer issues for the group please?

Max VE3TMT

...not trying to get away from Dan's original question, I am just curious about your problems. What's that they say "knowledge is wealth"

Paul,

There was a ham about 150 km east of me (in Cornwall Ontario) selling a complete TS850S, DSP100, MC60 mic with all cables etc, for $1000 CDN. I would surely have grabbed it but can justify it at this time. His email is ve3axp@... if you want to talk to him. $1000 CDN is a heck of a price for a TS850/DSP100 combo. His name is Gord. It may have sold, and at that price I wouldn't think it would take long, but you can enquire.

Max

4176. Different ouptut power depending on band ??

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-08 20:12:28 UTC
From: max_ve3tmt
Topic: 4176 Message: 4176

While running the RTTY roundup this weekend I noticed that when switching bands my power output is not neccessarily the same on each band. Now most were minor drops or increases, but the change is really noticeable on 15m and 10m. I performed the following experiment and got these results:

I went to 20m and injected a 1 KHz tone into the rig at a level equivalent to 100W out as noted on the 850's meter. Without changing the drive level I went band by band and got the following output readings:

75m 80W
40m 110W
30m 110W
20m 100W
17m 110W
15m 50W
12m 100W
10m 60W

As you can see, the output on 15 and 10m dropped quite a bit. Is something out of alignment with the rig? Possibly a control the maintains the same level output per bands?

Thanks,

Max

Paul,

I have a DSP-100 I put up for sale on QRZ January 3. There has been no interest so far. I have been using the unit again before what I presumed was going to be a sale, and they work nicely, in fact, I sometimes wonder if I should sell it? The noise reduction and filtering of the dsp-100/850 is on par with the 870. I would also consider a trade and some cash towards an SM-230. Anybody interested?

It has been almost 10 yeasr sing I worked RTTY with my 850. The last tiem was with an MFJ-1278B TNC. I no longer have the TNC and would liket to operate RTTY, PSK-13 and other digital modes, too, using the sound cards in my computers.

I downloaded HamScope and it decodes pretty well. Can I use the mic jack for AF in or is there a better way. My rig control keys the transmitter just fine, but I need to get the AF signal into the rig.

Hi Mark,

Personally I use a RigBlaster Plus into the mic jack on my 850. I have also used it into the 13 pin DIN on the rear. Either works just fine. I have also run the audio straight into the mic plug without any isolation which worked okay. Just this weekend I was casually working the ARRL RTTY roundup and made 113 contacts. I really enjoyed it. I ran 100w from the 850 and never had a problem. I use MixW software for all my digital modes.

73,

Max

Hi Mark

If you can use FSK and go into the back of the rig, you will find it works a lot better if you have CW filters in your rig. With AFSK into the mike jack, you are limited to the SSB filters in your rig. With FSK, you can use the CW filters. In a contest, SSB filters are way to wide.

If you don't already, you might subscribe to the RTTY list. Lots of great guys there and you will learn a lot. 73

Tom,

After working the RTTY roundup I was curious about using FSK mode. With the common PC configuration, how would one go about keying the FSK circuit? I am using a RigBlaster for the digital modes. Would I need a separate circuit from the PC?

Hi Max

Not sure about the Rigblaster as I'm not familiar with that one. I use the RASCAL from K4ABT at www.packetradio.com. Think they are about $40 shipped, and mine came all pre-wired for FSK. All I had to do is plug it into the back of the TS 450SAT--totally plug and play.

When running MMTTY, you just configure it for FSK and it is all set. I use N1MM Logger and MMTTY plugin for a really GREAT setup for RTTY contesting. The CW filters make it a lot more fun. I also have a FT-840 that I use for the second radio and it is set up for AFSK. I bought a little Autek audio filter to narrow the signals down a bit. Helps, but not like the built-in filters. The loud ones still pump the AGC really bad. 73

Thanks Tom,

I have the 500Hz CW filters in the 8.33 and 455 sides. I love the cascade effect with both 500s inlne.

When I operated FSK from my MFJ-1278B TNC, I had opto-isolators going into the back of the 850. I think it has an FSK/RTTY jack. I'll have to pull it out and check.

I agree that you need to use narrow filters - I can't even imagine trying to do an RTTY contest without. However, it is not true that you cannot use the narrow filters in SSB mode. On my TS-850 the 500 Hz filters work just fine in SSB mode - the bandpass is around 1150-1650 Hz or thereabouts. If you have 500 Hz filters in both IFs you can use the slope tune controls to narrow the response still further, just like you can in FSK. I used AFSK for several years, feeding the audio into the 13-pin DIN connector on the back of the radio.

That being said, I agree with you that if you can use FSK, it's better - but not because of the filters, it's because you don't have to worry about audio drive levels, splatter, or readjusting the mic gain control between bands. Now that I have my microKeyer USB interface, AFSK is a thing of the past here.

I am very curious about using the FSK setting for RTTY. I am using a RigBlaster Plus with the 850 for PSK and RTTY now. I would like to explore the possiblility of using true FSK but not sure what is required. I am using a data switch and use the Riblaster on port A and my CAT interface on port B. Will a separate circuit be required to key the FSK line? Does this mean I will have to give up one of the ports?

Any help appreciated,

Max

The FSK interface from a serial port uses TxD. The CAT connection also uses TxD. This means that you cannot do both on the smae serial port from the same software or at the same time - if you want both CAT and FSK during the same operating session you must use two serial ports, one through the IF-232C or equivalent level converter to ACC1, and the other through the Rigblaster Plus to the 850's RTTY input jack and PTT connection.

Also, according to the published circuit diagram for the Rigblaster Plus you can either do CW or FSK but not both, or at least not without changing jumper positions and cables when you change modes. For CW you would jumper RTS to the keying circuit and connect it to the radio's CW key jack; for FSK you would jumper TxD to the CW/FSK keying circuit and connect the CW/FSK keying output to the radio's RTTY input.

One warning: If you are using the West Mountain Radio cable to connect to the 13-pin ACC2 connector, you can continue to use it for fixed-level audio output, but do NOT plug the second mini phone plug that comes with it into the Rigblaster's CW/FSK keying output; the TS-850 does not support FSK keying input on ACC2. Instead, you need a separate cable with a mini phone plug on the Rigblaster end and an RCA plug on the radio end.

If you use a USB-to-serial adapter as a means of adding a serial port to the computer, be aware that this will not work in FSK with most software, although it will probably be fine for CAT, PTT and CW. There is one exception to this, and that is the EXTFSK plug-in dll for MMTTY. If you use this dll, then you can use a USB-to-serial adapter even for FSK. In fact, EXTFSK has other advantages - you can use DTR instead of TxD for FSK, which would mean you wouldn't have to switch jumpers inside the Rigblaster to go from CW to FSK, only the cable to the radio. For CW, you would configure your CW software to use DTR for CW and RTS for PTT. For FSK, you would configure EXTFSK to use DTR for FSK and RTS for PTT. Yet another advantage is that you can even use a parallel port to do FSK with EXTFSK, although you will have to wire up your own homebrew keying circuits for FSK and PTT, you can't use the Rigblaster for this.

One other point to note: MMTTY and EXTFSK require exclusive access to the serial port. That means you cannot switch the port back and forth between other software and MMTTY/EXTFSK during the same session (e.g. to quickly load the radio's frequency into your logging software and then jump back to MMTTY for RTTY). You must choose one or the other and stick with it; the only time you can use other software that is configured to use the serial port for any purpose is when MMTTY is shut down.

And one final note: to use FSK with the TS-850 you will need to set the TS-850's power-on menu item no. 11 to ON; the default OFF position results in transmitting inverted polarity.

Rob,

You don't need the IF-10 with the 450. That circuit will work just fine. I have used it on both the 450 and 850.

Max

> Rich VE3IAY

Thanks Rich,
I never thought to check the RB's manual!! I would rather set it up
for FSK than CW. As is now to key the rig in CW I have to use the
dedicated RB port and lose my PC control for logging etc. I don't mind
this for FSK. I will read further tonight.

Thanks for the advice,

Max

Richard Ferch, ve3iay wrote:

"If you use a USB-to-serial adapter as a means of adding a serial port
to the computer, be aware that this will not work in FSK with most
software, although it will probably be fine for CAT, PTT and CW."

Interesting. I have an USB interface to my rig control, one each for my Kenwood and ICOM radios. My laptop does not have a 25 or 9 pin serial port so I have to use an USB to Serial converter. With only USB ports, how do I get FSK out of my laptop? I'm using HamScope with MMTTY.

If you are using MMTTY, you should be able to do FSK from a USB serial adapter by installing and configuring EXTFSK. This is described at:

http://aobajoke.no-ip.org/~ja7ude/info/mmtty.htm .

You can find the actual files you need at:

http://mmhamsoft.ham-radio.ch/extfsk.htm ,

specifically in the file:

http://mmhamsoft.ham-radio.ch/files/programs/comfsk105.zip .

If you want to get fancier, there are a few all-in-one amateur-radio USB devices out there that will do CW, PTT, FSK and various other functions from a single USB port - see:

http://www.microham-usa.com/Products/mk.html

http://www.rigexpert.com/RigExpertPlus.html

http://www.hamradiosolutions.com/site/pages/products_dett.asp?ProductID=15

for some examples (warning: these are not cheap! I have a microKeyer and I love it, but they may not be for everyone.)

73,
Rich VE3IAY

Hi Rob

Goto Ebay and look for G4ZLP's cables. He makes a great cable for that. I have one for my TS-450 and one for my FT-840. Price is very reasonable and he is very fast on shipping and great service afterward. I bought mine for about 35 USD shipped. 73

I see many references to TXD in the manual however the so-called TXD
LED that is supposed to flicker doesnt exist in the RigBlaster Plus.
At least not in mine. I could get the rig to key but not
diddle-diddle. I don't think you will hear this in the monitor????

Is anyone using the RigBlaster Plus with a TS850 using direct FSK
keying? I'd like to know what jumper settings on P5 you are using. In
the meantime I'm back to AFSK :(

I am not familiar with any Yahoo groups specifically for RTTY, other than those for individual software like MMTTY, but the most popular RTTY e-mail reflector is at www.contesting.com . Anyone can view the archives at http://lists.contesting.com/mailman/listinfo/RTTY , but if you want to post you will have to subscribe (you can set your preferences not to receive individual e-mails, just like at Yahoo).

Hi All

Just got my hands on a kenwood ts850s and what i have found with this radio is that when i'm listening to a signal on lsb and switch across to usb there is no difference at all, when i'm on usb ,lsb sounds the same?.
Anyone had this prob and what could be wrong?.

cheers from Jason ZL2FT.

Jason,

What is your filter bandwidth set at on receive? If you are too wide
you will hear the signal on both sidebands. Set both filters to the
2.7 position and try again.

Max

Subject: [TS-850_450_690] no difference between lsb and usb

Hi All

Just got my hands on a kenwood ts850s and what i have found with this
radio is that when i'm listening to a signal on lsb and switch across
to usb there is no difference at all, when i'm on usb ,lsb sounds the
same?.
Anyone had this prob and what could be wrong?.

cheers from Jason ZL2FT.

THANKS FOR USING TS-850_450_690@...

First off, make sure that the knobs of the slope tuning (lower right corner) are set correctly. The outer (larger) knob should be fully counterclockwise and the inner (smaller) knob should be fully clockwise.

Thank you Tom,

I have sent an email to Neil.
For your information, and also for my friends in unlisted country,
Neil also receives an International Bank transfer.

Best Regards,

dy YD?NHO

4223. Only 75watts max peak on ssb

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-12 22:00:27 UTC
From: jason
Topic: 4223 Message: 4223

Hi All

I have read that these radios can have a lower powerout than 100watts
on sbb, mine is peaking at 75watts max in ssb mode.
In fm and am mode with a carrier it is at 100 watts output.
What i'm thinking of doing is adjusting the power output pot until it
peaks at 110 watts in ssb.
Has anyone else done this adjustment?
My ts50 has alot more drive peaking at 120watts regularly in ssb mode,
so i'm hopeing to get the 850s peak at least at 100 watts (where as at
the moment it's only between 50-75 watts max at full power).

cheers from Jason ZL2FT.

Hi Zack
Thanks for the reply , tried the slope as you mentioned but no
difference still between usb and lsb on rx.
It's not a AM sig i,m listening too as someone mentioned.
Also tried the filter settings and found that the 2.7k settings
helped but the rx was tinny and thin on ssb.

cheers from Jason zl2ft

Mine has run at ~100 watts since new.

Read on a Nye peak meter.

Sounds like the carrier point is out of adjustment. Does it sound
tinny on one sideband only?

Max

Whistle into the microphone. The peak SSB power is about that amount.

I have never met a peak-reading power meter that correctly responds to
voice peaks. On my peak-reading Bird, I see about 75 watts peak,
while my high-speed oscilloscope is showing 100 watts. If I whistle,
the scope shows the same peak, but the Bird shows 100 watts.

Do not turn up the power on the TS-850. The PA stage can handle a
sudden infinite SWR (such as an antenna blowing over in the wind) at
100 watts, but not above there. Also, the splatter off-channel starts
getting worse rather quickly above 100 watts.

What are you using as a signal source for this measurement, and what
kind of peak reading meter are you using?

I don't whistle...

I use a two tone audio from a Kenwood SM220, into a tectronics 422 scope
with a P-7 phosphor - I get same output peak on SSB as CW and RTTY
(direct FSK).

The Nye is a very fine meter... ARRL lab tested it and found that it was
one of the best < 5% error.
Better than the Bird peak.

4230. Slow or no Rx upon turn-on!

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-13 00:32:31 UTC
From: H.L.
Topic: 4230 Message: 4230

Hello All,

"SLOW turn-on gone to NO Rx upon turn-on" Ideas anyone??

I'm new but have been reading mail. I've had my 850S/AT for fifteen years, since new, and have done little other than align occasionally and replace a memory battery, not particularly needed, every few years.

HOWEVER, recently I have experienced new meaning to SLOW upon "turn-on". Now, the rig will frequently not start receiving signals at all unless I allow it to "warm" a little and then I have to turn it on/off (slowly) a couple of times in order for it to begin receiving understandable signals.

I called Kenwood East and they said to send it in - however, before I do that have any of you experienced or heard about this little quirk???

Thanks Mac KJ4PW

4231. PC radio interface

Date: 2006-01-13 01:58:52 UTC
From: Phono-Guy
Topic: 4231 Message: 4231

I've been considering one of these for awhile, and I
would
soon like to try my luck at some digital modes, so I'm
trying to
see what others are using? I was about to get a
WestMountain unit, but then I saw a posting here for
the Tigertronics interfaces which look like they would
work just fine, and are less
expensive. I have older & new Kenwood radios so would
like to have a interface that would work equally well
with all.
Any info appreciated,
73,
Clint - WS1V

Hi Clint

I use the RASCAL interfaces here. You can see them at www.packetradio.com.
I have one on a Yaesu FT-840 and TS-450SAT. The neat thing about the one for
the Kenwood is that I ordered it wired for FSK and it just plugs into the
back of the rig and works great. Price is right too. 73 and GL

4233. goodbye 850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-13 17:39:52 UTC
From: k4pdm
Topic: 4233 Message: 4233

It was with much sadness that I bid goodbye to my TS-850SAT
yesterday after selling it on qth.com.

My situation now is that I can only afford to keep one rig around,
and I probably made 3 QSOs per week on the 850. Once I get a do-it-
all mobile rig, I'll probably be much more active.

Of course, there is nothing to keep me from later selling the little
radio and buying another 850 if I choose, but even so, it is tough
to give up a radio that looks so good and works so well.

There is no real point to this post, other than to share my feelings
with others who can relate! At least, I hope you can, at least a
little.

Goodbye 850! May your RF spend many more years bouncing hither and
yon from the ionosphere, circling the globe, bringing DX and
conversation to other lucky owners, as you continue to outperform
future generations of digital, flashy "space ranger" radios.
73,
Paul K4PDM

Hi Paul. I recently found myself in a similar situation and had to part
with a *really* nice rig (not a kenwood). I feel fortunate though that it was
not my only rig, and that there are many others who have had to give up
hf operating altogether due to circumstances beyond their control.

I guess those moments occur to all of us, but I've found that the enjoyment
is still there, and that's what counts. I may end up bumping two
wires together
to key a qrp rig, but it will still be fun.

73 & GB,
Rich, N8UX.

Sorry - please don't misunderstand the context of my statement. I didn't
mean that Kenwoods are not nice rigs - they are some of the very
best. I should
have said "really expensive rig". Well, actually not that Kenwoods
are cheap...um...
hope you all know what I mean.

Ok, I'm done digging my hole - I'll just go ahead and jump in it now.

Rich, N8UX.

Paul,

I have been in your exact position three times in the past, meaning the 850 I now use is my fourth! Each time I sold or traded the others, I could have kicked myself. But I did, again and again. I felt very fortunate to find this one in the shape it was, and after giving it a nice new front panel it looks just like new. This one will stay in my shack forever. I agree, something about the look of the Kenwood mesmorizes you. I think the only other rig I've owned that I liked as much was the FT-920, I would love to have one of those again. I hope you still participate in the group, I know it was hard for me when I was without mine, but we value every members input.

Max

4239. Re: Only 75watts max peak on ssb

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-14 00:27:52 UTC
From: Dave
Topic: 4223 Message: 4239

The Bird peak kit can be calibrated to be within 1% of the non-peak reading. The challenge lies in the response time. A single CW "dit" brings the meter to the peak value. However, a two-tone SSB signal has a rounded, not a square, top, and that's why the Bird peak meter fails on SSB peaks - as do the three non-Bird peak add-ons for the 43 that I have tested.

I do what you do - I use a 'scope, and perform a relative cal of the scope.

73,

Dave W8NF

Hello All:

My TS690 is very ill. I took it apart and found K17 (MATSUSHITA DS1E-M-DC12V) and D12 (looks like the pix on the start page of this group)smoked.

Anyone know of a source for these parts? Just need something that will fit into the PC board.

Thanks

Bob Rogers

Seriously, Dave, I did consider using the 850 in the seat next to me, as I only use ham radio when driving alone anyway. I have used some fairly large radios that way. But the idea of lugging that beautiful piece of equipment back and forth from the car, possibly bumping and scratching it, did not appeal to me. I have worked some mobile 850s, so I know people do it...

4251. Re: goodbye 850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-15 17:26:44 UTC
From: Dave
Topic: 4233 Message: 4251

When we moved state-to-state recently, my wife and I drove separate vehicles. We had VHF rigs to stay in touch with each other, and I had the '850 with me, and a collection of Hamstiks. Only a few weeks previous, I had been borrowing an Icom IC706 for mobile work. The '706 has a dreadfully phase-noisy receiver, which makes the mobile noise worse than it really is. Many hams incorrectly assume that since RXed sigs are weak in a mobile situation, that a poor RX like the IC706 is suitable. It's not. The LO phase noise spreads out the damage done by any noise source. With the '850, I could hear so much better, and the dual NBs handled the mobile noise better, as well. Of course, were I to get serious about mobile, I'd take care of some of the noise sources "at the source", as it were. But that still doesn't fix noise coming from other vehicles, so a good noise blanker is still a requirement.

Mostly, I don't work mobile. If the trip is of any length, my wife is with me, and I prefer to QSO her with baseband acoustic, rather than other hams on HF. Sorry, guys... ;)

I found a substitution for Matsushita Relays DS1E-M-DC12V is available as a Panasonic DS1E-M-DC12V from Digikey for under $5.00 (US).

Thanks Dave VE3WEJ for the Kenwood P/N for the supressor... Looks like I'll be back on the air within a week....

4253. 850 Power up no receive, wait, power down and up again and it works???

Hello Everyone!

Let me try this question another way. After 16 wonderful years of relatively trouble free service my beloved 850S/AT now shows some sign of wear and tear.

When powered up it frequently will not receive any signals. After leaving the power on for about fifteen minutes or so it can be powered down and then powered up again and frequently the receive will pick up at that point.

Have any of you heard about this problem???

KJ4PW Mac Good on QRZ

I have a TS-850S/AT doing almost the same thing. Sometimes doing
a "hard reset" fixes the receive for a short time. Sometimes the
power up and power down trick works, but I want mine fixed too.

You are not alone. Maybe someone knows, I hope.

From: Fred Wolf
Topic: 4257 Message: 4257

Long time lurker now making first posts! Thanks all for great reading.

Some time back, I wired up a homebrew interface to work PSK with my 450sat. Using ACC connector, it worked great, until I wanted to work some SSB. Had all kinds of noise on my xmt audio. Found a mod to the radio to drop gain on ACC audio input, but it involves going inside and working with some SMT stuff. Prefer trying any kind of external changes to get things working. Anyone have any success with the 450 and changing back and forth between phone and digital?

I think we should always remember that
Matsushita is just Japanese for Panasonic
(actually, Panasonic is the USA/Canada brand
name used by Matsushita for their products here,
so it's more true than the bad attempt at a
joke I was trying to make).

Much of their electronic component line is
available here with the Panasonic branding.

From: KD5SFA
Topic: 4253 Message: 4259

Is it possible that you have a intermittant
connection between the receive side of the
T/R relay that after it warms up the thermal
expansion allows contact ? That would be a good
place to start tracing it back by injecting a signal
at that point or at least using a jumper to bypass the
relay. I have a TS-700sp that after it warms up the
receive goes away and the s-meter doesn't work as it
should. I have not had time to bench it and trace the
receive side yet. I suspect it is a bad solder joint along that
line.

Fred,

What are you using for digital generation...RigBlaster, KAM etc??

There is a mod for the KAM concerning distorted audio on the 850.

http://www.mods.dk/view.php?ArticleId=1733

Another option would be to build a switch box to disconnect the audio
from the ACCY connector when not in use. Or use a Rigblaster so the
tones are disconnected when in SSB mode.

Max

Thanks for reply, Max. The same mod is recommended for the 450 used
with KAM. I'm using sound card, connecting through my interface to
the ACC input on the 450. The effect of leaving the connector in
place is seen on output rf continuously when I switch to SSB.
Without the ACC connected, there is, of course, no rf output in ssb
until some speech is presented to the mic. I think the mod to the
ACC audio input circuit might solve this problem. I will try your
idea for switching and see if I can eliminate the noise problem.
Might also try grounding the audio in, see if it has any impact on
the audio through the mic circuit.
Problem with the mod is diddling with SMT. I thought, with a good
schematic diagram, I could look at the effect of this mod, perhaps
figure out a way to do the mod external to the 450, and thus avoid
the challenge of SMT mods. Working on getting some clear drawings

for schematics and for pcb layouts for the IF Board so I can
translate the instructions from the mod into actual circuit layout.
Life can be soooo complicated some days!!

Hi

I am using a TS-450SAT here with the RASCAL interface. I leave it plugged in all the time, along with my mike. I run FSK on 1 radio and AFSK on the other. I have never had any interferance problems on either RTTY or SSB.

Make sure that your mike is not open when sending RTTY or you will pick up all sorts of noise through the mike while sending RTTY. My PTT button closes both the PTT and mike circiut. 73

Fred,

Just a wild guess here, but have you tried muting the sound card output (in the Windows Volume Control application) when you are on SSB? If that doesn't work, are the various signal lines connected to ACC2 all shielded?

If that works, but you don't like reconfiguring the sound card every time you go into or out of digital modes, you might investigate QuickMix (at http://www.ptpart.co.uk/quickmix/) which allows you to save the settings so you can switch more easily. On the other hand, if this trick doesn't work or you have already tried it, just ignore this!

4265. Original and new encoderM.ch/Vfo.ch on 850, number of pin ?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-18 23:12:44 UTC
From: Allan
Topic: 4265 Message: 4265

Hi all,

I'd like to change the M.ch/Vfo.ch encoder on the 850sat.
So I contact kenwood France and ask them the item W02-1660-05.

I just finish to the 850 and I see that the original has 6 pins and the new one (send by Kenwood) has only 3 pins ... I see a notice with the new encoder "parts n°W02-1660-15.

But on the original encoder, only 3 pins are using so I think it's normal .

Could you confirm me that ? Because I'm not an expert on electronic.

Many thanks for your help,

Regards

Allan

Hy Espedito,

Yes I am using TS 850 and DSP 100 with home made inteface RS 232 for
computer and it works evrything O.K.
You have to use cont out on DSP 100 for RS 232.
If you turn off DSP 100, IF 232 will not work!!!

To check up first connect RS 232 direct to TS 850 and if that working,
probably you dont have any problem to work with DSP 100.

Any problem..... just post mesage..

Topic: 4268 Message: 4268

Hello friends
I have a idea for install filter for 455khz into my TS450.(in mamual is written that this slot only for CW 455khz optional filter).I find on net interest filter from INRAD :
"INRAD-96 TS450S/TS690 INRAD 2100Hz/455kHz for KENWOOD TS450S, TS690"

On position 8.883 I have also Inrad 2,1khz which work great.
My question:
It is some differencies between internal 2.4khz crystal and 2,1 khz optional filter on 455?Have somebody this into 450?Its good idea or "save your money"
Thanks for any answer Tom
(Sorry for my simple english)

The TS450 works perfect for digital modes through the ACC connector even with a simple home brew interface using Com or Audio generated PTT at the interface. Check your sound card controls, its outputing Windows sounds PLUS RFI to the 450.

OK, everyone! The 850 is on the way to Kenwood East as we speak! I will post the results of their diagnosis as soon as they let me know what they think is going on.

"Slow to turn on" is a familiar phrase for 850 owners, "receive won't turn on" is something more radical - maybe we will have this answered soon????

>"Slow to turn on" is a familiar phrase for 850 owners, "receive won't
>turn on" is something more radical - maybe we will have this answered
>soon????

I currently have two 850s I'm working on - one is considerably slower to light up than the other - a few seconds. The slow one has had the battery replaced a couple weeks ago.

Will be following your reports closely on this anomaly.

Thanks,
Rich, N8UX.

4273. What fails on the DC-DC converter board?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-23 20:35:16 UTC
From: Dave
Topic: 4273 Message: 4273

My '850 has developed the seeminly famous DC-DC converter problem, causing the ALC on transmit to spike high, momentarily driving the TX output to zero.

I've noted that there's a "patch repair" consisting of adding some resistors to the DC-DC converter board. This repair scares me. Without knowing the underlying cause of why a previously-functioning rig suddently behaves differently, I fear that this patch is simply covering up something, and that the symptom will come back later.

Has anybody actually determined what component(s) are going bad?

On my '850, this is not a problem that has been slowly coming - it showed up a week ago and has consistently behaved like this since then; this is a fairly clear sign that something has distinctly gone amiss, and adding resistors to "adjust" a marginal design is not the correct solution.

I'm headed toward ordering a replacement board; in the meanwhile, the rig dialed back to 10W driving my SB-220 gets me still on the air at 200W, which is more than enough for any operating I routinely do.

TIA,

Dave W8NF

Also I have a problem on the ALC however the card I have preferred not to change it for the moment in how much I work all good except this small oscillation of the ALC due to the X59-1100-00 card, for hour I hold it in this way I work from 15 years hi!tk5ep.free.fr/tech/ts850/DC-DC/DC-DC.htm all it is very explained, even if the removal of the card is difficult, hello soon

4276. TS850SAT

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-23 23:07:54 UTC
From: johnnygm7lsi@aol.com
Topic: 4276 Message: 4276

Hi Folks,
My much loved and trusty 850 has developed a fault and I wonder
if anybody else has stumbled on the one. The first thing I noticed was when I
used the auto tuner, it went thru the motions when activated, IE, the usual
whirring of the motors, but it just sends the "CAN`T TUNE TONE" after trying
to tune for the preset time. I also tried the 850`s manual tuner but no joy.
So to get back on the air quickly I purchased an MFJ949E manual tuner. While
using the MFJ to tune, I turned down the power and switched to FM and found I
wasn`t putting any power out on FM or AM. Everything else seems to be fine,
IE max power on usb/lsb.

Johnny,
GM7LSI. Elgin, Scotland.

Simplest and, hopefully, not too insulting question......Does the rig put any power out while tuning? Is the CAR control turned up to make sure it is putting out power? (I have momentarily forgotten this after not having used the rig for a while...)

If CAR is turned up and still no power while tuning, you must solve the power problem before worrying about the tuner, which still probably works.

Hi Ken,
Thanks for the advice, and no, you weren`t insulting, and yes
you were correct, I must have turned it down when I was cleaning the rig. All
working fine now thanks to you. A BIG thank you, I feel I right TWAT now.

Many thanks again, Johnny, GM7LSI. 73`s

Simplest and, hopefully, not too insulting question......Does the rig
put any power out while tuning? Is the CAR control turned up to make
sure it is putting out power? (I have momentarily forgotten this
after not having used the rig for a while...)

If CAR is turned up and still no power while tuning, you must solve
the power problem before worrying about the tuner, which still
probably works.

I did the same thing Ken, I was working some PSK stations down on 40m one night when a guy came on with lines all over the waterfall. It went away of course when he stopped transmitting, so I fired him a line complaining about how he was wiping out the band with his splatter. As soon as I turned of the NB it disappeared. I apologized to the guy and we had a great QSO. I notice the same effect on strong SSB signals too. Total crap to sparkling audio at the push of a button.

For some odd reason, certain settings of the notch filter cause
received splatter too. Somehow, the notch filter can impair the
action of the receiver ALC. If that happens, backing off on the RF
gain usually helps.

I'm in constant amazement when I listen to the ESSB guys trading
signal reports. They report "40 over S9" and other preposterous
numbers. I can make the S-meter read that high, by fundamentally
operating the rig incorrectly.

I set the AIP and RX attenuators so that the background noise floor
does not move the S-meter. On 80 meters, with my 75 foot high
inverted vee, I'm usually running with AIP "on" (preamp off) and the
12dB attenuator kicked in. The noise just barely makes motion on the
S-meter. If I do this, then it's rare for me to see a 10dB over S9
signal, and the receiver sounds fairly open and clean, and the NB
seems to work better.

Our modern rigs give us lots of options for tweaking in a signal and
gtting rid of interference. Each one of those options is also an
invitation to misinterpret what we're hearing. It's worth remembering
that a receiver is not a piece of test gear.

73,

Dave W8NF

Dave,

Very interesting reading. I am going to give your observations a try. I do get a lot of noise on my vertical on 40m and 80m where I run a longwire. Of course on a lot of signals the noise is so high it is hard to hear the station. I always run my 850 with the AIP on. I don't know if my S-meter is calibrated or not, but I rarely get a 30 over 9 signal unless I put the preamp on. I have a console TV upstairs with a switching power supply that just drives me crazy. I installed a switch on the rear to shutoff the AC line when not being watched. You wouldn't believe the difference it makes.

So now, thikn of a city of 100,000 homes, each one with a TV set with
a switching power supply.

That's why, when you're mobile, you can tell that you're near
population because the background noise on the lower bands rose by
20-30dB!

4290. Kenwood TS850 <> Acom 1000 relay wire

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-01-28 13:31:19 UTC
From: pa7two
Topic: 4290 Message: 4290

Hi Kenwood lovers,

My good old Kenwood TS850 needs to be paired with a ACOM 1000 amplifier. I would prefere full QSK operation if possible but cannot find too much info how to hook them up relay wire wise.

Has anyone done this before and like to share how to do this with me (us)?

If full QSK is not possible than the normal hookup I am also interested in, in detail please.

Looking forward to your replies,

Kind regards and 73, de Kees - pa7two

4291. the Kat-2 works ts-690???

I lost one of the DC-DC converters in the rig and had the semi-famous ALC problem. I popped open the rig to find that the board appears to have been replaced once already and the two resistors had been paralleled. Whatever it is that fails must continue to get worse even with those resistors tweaked.

PacParts got the new board to me two days after ordering it and it took but 20 minutes to install. Maybe some day I'd be up for really digging into it to find out what the weak spot is and come up with a permanent fix, but for now, boards are cheap and quick and the installation is, too. I managed to leave a solder short between two pins on the DC-DC converter board. The symptom when I turned the rig on and transmitted is that the ALC was nailed high, and the radio was delivering just under 300 watts. Glad I was transmitting into the big dummy load - into a poor SWR, that would have toasted the finals for certain!

As long as I had it open, though, I took another stab at the tuner. Mine's been screching and squawking for quite some time, even though I attempted to lube it per comments on the list.

This time, I set about really getting to the gears and stuff. Once the tuner's out of the rig, the top cover of the back half comes off with four screws, and a few plugs get unplugged. I often label plugs for what connector they go back into, but in this case, each plug has a different number of pins, so you can't reassemble incorrectly.

Some more screws come out of the front cover, which wraps around the two variable caps and motors. Then, with great care, this cover slides off the tuner towards the front. There are some tangs which capture and align the capacitors. I pried gently with a flat blade screwdriver to get these tangs over the capacitors. This has to be done several times on top and bottom. Finally, the cover slides off to the front.

Now, with the tuner out and disassembled, you can apply 12V (or 13.8V) to either motor and get the capitor to rotate. Apply the voltage in short bursts, so that you can tell if you've turned against a stop. The capacitors have no stops, but the potentiometers do, and if you try to drive the pot against the stop, you can cause the worm gear on the motor to "snap" over a tooth. That causes no misalignment, but obviously risks a broken tooth. You can see when the pot has hit the stop because the pot twists a bit when you do that. Best to avoid doing so, obviously.

You do not have to disassemble any further, for instance, removing the motors is not required. I used tri-flow teflon lube in several different spots, each time using the 12V to spin the cap from one end to the other and back several times. In the end, it turned out that the source of the screech and squawk was the motors themselves. So I upended the thing so that the motor worm gear was poking vertically up, spritzed the lightest possible bit of teflon spray, and then ran the motor back and forth to work it into the shaft. There is no way to get to the rear bearing, as far as I can tell, hopeully it's the front bearing that's in trouble.

Before I realized it was the motors themselves, I'd thought I had it and put it together- then it screeched again ,but a lot less. So I had to take it apart two times.

So, for the first time since purchasing it, my TS-850SAT does everything it's supposed to do, and does it without complaining.

My celebratory QSO for getting the rig back on the air was to work FG5FR in Guadeloupe on 30 meters.

Dave,

You inspired me to fix my ALC flucuating problem. I wasn't sure if it was infact causing my problem, but I noticed on PSK31 my power would rise and fall from 25W to 50W and back and forth. I removed the 22K and put 15K in their place. After testing last night the power output is stable. I think I finally have all the bugs worked out.

Here is a question to the group,

I have the 850 set at 110W output (FM MODE) and the meter shows the same number of LED's lit on each band, one lit after the 100W mark. However the current draw from my power supply varies anywhere from 10A to about 17A according to the meter on the supply. Shouldn't the current draw be the same on every band if the power output is the same? Whch reading should I trust?

Max

Max,
No, the efficiency of the rig will vary from band to band. And you cannot really trust either one as a measure of power output--you need a wattmeter of known accuracy feeding a dummy load for that.

My 850 (now sold) drew anywhere from 17 to 20 A on my Astron meter at full power, but I cannot tell you exactly how much power that was! Your 10A reading is only 138W input at 13.8V, so something is definitely reading incorrectly.

Paul,

I believe it is a Pyramid supply. However I forgot to mention, my output, into the dummy load shows the same amplitude on my Heath monitor scope, or very close to the same levels.

My $.02...
If amplifier efficiency varies with frequency, due to variations in
transistor activity, filter Q, etc., then the current drain will
change for same power output.

any other takers?

Hmmm...I was on last night. Saw a minor version of the ALC problem show up again. On CW, mine makes a little AM modulation when the ALC problem shows up. This is with a new DC-DC converter board. Will have to dig out the 'scope and see what's up. At least you can get to the board to make measurements while the rig's running. I think, though, I'll hold off a bit; I have a higher priority project that was already interrupted by my "repair", which turned out more to be an "improvement".

Yep, and amp gain varies with frequency. That's one purpose of the ALC system, to more or less force the amplifier into delivering the same power on each band, regardless of the amp's actual gain or saturated power capabilities.

If the rig is delivering a true 100W, then the current readings are suspect. Mine shows from 22 to 26 amps on an Astron meter at 100W output, measured on a Bird 43.

4299. swr reading changed on tuned antenna

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-02-01 09:08:50 UTC
From: jason
Topic: 4299 Message: 4299

Hi All

I have noticed tonight that the swr reading on my 850s has gone up.
I went outside and lower the di-pole and checked it over no probs
found.
Still the swr had gone up from 1:1 to 2:5 on the resonent freq and
also on 40 the swr has changed.
So i put the antenna into my ts2000 and checked the reading and it's
tuned flat on the resonent freqs on 80/40, put it back on the 850s
and the redaings are backup to about 2:5.
The antennatuner is off and i've checked all the settings and
everything is fine, i also did a partial reset still no luck.
The radio has been going fine until now , no swr fluctuations or
backing down on power.
Now i have to use the tuner on 40 and 80 and it also is having a
problem matching the antenna on 20mtrs where in the past few weeks
its tuned the antenna fine on 20.
Has something gone wrong in the swr circuit or tuner?.

cheers from Jason zl2ft.

Jason,

Did you try the 850 into a dummy load bypassing the internal tuner? If so and it is still out, I would retune the SWR section.

Hi Max

Yes tryed bypassing the internal tuner no luck, stll high reading.
Not sure how to retune the swr section, might have to send off to tech.
But it was good a couple of days back so can the srw section just go
out like that, suddenly?.

cheers from Jason.

4304. DC - DC board some info..

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-02-02 21:46:52 UTC
From: Colin J Thomson
Topic: 4304 Message: 4304

Hi..

A friend of mine sent me some details regarding the DC -DC Board, details
below:

###
Changing the resistor is *not* a permanent fix as suggested by others..
I did originally post the appropriate repair but with time this seems to
have been lost.
Q3 is a germanium transistor (god knows why) and it does go leaky.
Changing R4 may appear to fix the problem but Q3 will eventually fail
completely.
Its better to replace Q3 with a silicon PNP device. I used a BCW30 simply
because this is what I had at the time.
With a BCW30 the gain is higher so R4 needs increasing to 100K.
Once this is done the "fault" will *not* re-occur

Keith G4FUF
###

I hope this helps someone,

Hi

I was'nt using the tuner at all in the ts2000 and the antenna some
weeks back was tuned on 40 and 80mtr bands with a very good swr
acheived on the bands.
Still the 850 says that it is all out of wack, i can also put it on
a ts50 and manual ant tuner and check swr and all is good.

cheers from Jason.

Greetings folks,

Guess this is an example where the brevity in response we were implored to adopt has just gone too far! (Occums razor went too far??)

Having said that, the thread did initially indicate that it was the 850 (thus my belated addition to the Subject header).

Now while everyone (unfortunately) can't own an 850, this is the rig which does suffer from the DC:DC board problem (must admit I can't comment on the 690 or 450). Personally, I'm delighted that the 'real' culprit (on the DC-DC board) has been identified as Q3 by Keith G4FUF, so 'thank you' Keith and Colin G6AVK for passing it on.

It's already been copied into my 850 file, as I figure I will do the swap before I finally re-align the rig. I'm restoring an 850 which took a lightning strike/surge - through the PS! Given the state of the IF board, I'm glad I wasn't there when the PS went off.

Cheers
Steve VK2XWL

4309. ts-850 problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-02-03 05:46:41 UTC
From: setnetter99647
Topic: 4309 Message: 4309

Turned the rig on the other day and the receiver was dead, there would be static only if I turned the rf gain knob to 12 o clock, any other position would be complete silence, even at the 12 o clock position it was just static anywhere I tuned the vfo.
Anyone have this problem before?
Thanks,
Ron AL7Dx

Colin,

That has to be the single most valuable bit of TS-850 service info I have ever seen. Anybody who's worked in reliability engineering knows that germanium transistors are a problem waiting to happen, so this completely deals with it. I presently have a DC-DC board which is "new old stock" (Pacific parts just shipped it to me a week ago as new, but the manufacturing date code appears to be 1996), with symptoms that could readily be explained by a leaky Q3.

And why not? At $650 used, they're cheaper than half a year's lunches
at the company cafeteria. Bring tuna sandwiches to work for six
months and you've got one. That's how I got mine!

With a BCW30 the gain is higher so R4 needs increasing to 100K.
Once this is done the "fault" will *not* re-occur

The NTE equivalent for this transistor is an NTE2407 Silicon PNP
Transistor General Purpose Amp, Surface Mount

It is a good point to mention the radio being discussed. However as mentioned in the past, it is just as easy to do the following...

When replying to a message, keep only the original message in your reply if you choose. This will allow the readers the opportunity to read the original query as well as your reply. Some of you are replying with 3 or more replies from others in your reply. Who wants to read a reply that scrolls for 50 lines??? Not me.

So please trim your replies to make it easier for all of us to follow what is being discussed. Of course the other option is to set everyone to moderated, but I don't have that much free time to trim all the messages myself.

Would it be prudent to replace Q1 and Q2 as well? Are they also
germanium? If they are indeed germanium, I have to assume Kenwood
had a reason for it. Then again, maybe not.

Owning/working at a repair facility for 25 years, I found it best
to ask a lot of questions before applying the 'ol slobberin iron-hi.
I have two 850's on the bench waiting for my attention to the DC-DC
board anomaly.

From: Terry
Topic: 4318 Message: 4318

Hi Fellow Kenwood fans,

I have a Front panel assembly for the Kenwood TS-850. It is still in it's wrapping with the origional Kenwood parts card and is as new.

Part number: A62-0043-03

I do not want cash for it, instead I would like to exchange it for a quality 2m linear amplifier with inbuilt preamp above 100W (no homebrew).

If not it will go on ebay auction.

Best Regards,

Terry G0VHS

OK, my last Email to the group never made it??
So to clear things up about this:

2SA devices are germanium PNP and 2SB are NPN, 2SC/2SD are silicon.
(I remember this from my early construction days) More info below..

http://www.mikroelektronika.co.yu/english/product/books/keu/04.htm

Time to close this Topic and try the mod Hi!

From: JamesMNelson
Topic: 4299 Message: 4325

Jason,

Take a look at this.

I have found that the TS-450/690s have what we think is a design flaw. I would think that the 850 would be same way. From the SO-238 that is located on the back plane of the radio, there is a solid piece of wire that runs down to the filter board. I think that it should have been stranded. On both of the 690s that I have, and several 450 that I have fixed for friends, this wire had developed a cold solder joint at one end or the other. Most likely, I would think, from stress on the SO-238 caused by moving the radio around while the cable is attached. When we would put pressure on the SO-238, the problem would go away. Sometimes you would have to push up or down on the connector. Sometimes you would have to push in or pull out on the connector a little bit for the problem to show up or go away. You can easily get to the back of the SO-238 to reflow the solder, but to correctly reflow the filter board connection you have to remove several (10-15 if I remember correctly) and several RF inputs and outputs, not to mention all of the control cabling to remove the filter board. What you can do to check the filter board first is the GENTLY pull up on the short solid jumper from the SO-238 while the cover is off and see it that helps. If it does and you are sure that the bad joint is not on the SO-238, then you have your work cut out for you.

Hope this helps. Any questions drive me a line.

james//

Hi

I was'nt using the tuner at all in the ts2000 and the antenna some
weeks back was tuned on 40 and 80mtr bands with a very good swr
acheived on the bands.
Still the 850 says that it is all out of wack, i can also put it on
a ts50 and manual ant tuner and check swr and all is good.

cheers from Jason.

Clint, I started using InRad filters years ago and prefer them to the Kenwood CW filters. I have cascaded 400hz filters (8.83 and 455) in my 850s and found them to be excellent. My Omni VI+ has five InRad filters. My Orion has an InRad roofing filter.

4328. TS850 using VFO A & B for split?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-02-11 02:51:11 UTC
From: taephono
Topic: 4328 Message: 4328

After playing with my newly acquired 850 for a few days, and reading
the manual over & over, I still haven't figured out a quick way to
setup the VFO A / B split operaton, I do get it to work but it seems
I have to go thru alot of motions to get it there, so I must be missing
something...:)
and the manual isn't written very clearly to explain this.

Can someone explain to me the quickest way to set
up the VFOs for a split on the same band, keeping VFO A on the received
station, and putting VFO B at a different tx freq.

Thanks,
Clint

when you have the selected freq in vfo a, tap the a=b key

then select the button below the rx tab, and the second below the tx tab

while holding the tf-set (stands for transmit frequency) turn vfo dial, and your transmit freq will adjust to where you are trying to go....

Here's how I do it Clint...

hit RX A, tune the dx.

Hit A=B.

Hit RX B, tune your tx freq in the pileup.

Hit RX A, then TX B. The "split" display will appear.

Work DX!

Hold TF-SET while tuning to find the guys he's working. When you release,
you back rx'ing on his freq, and transmitting on the new split.

May not be the best way, but it's how I do it.

OK... that's what I started doing today using the T_F set button to move up the tx freq... so I guess I'm catching on.. :)

Appreciate the help,

Clint

4333. Working Split

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-02-11 13:18:10 UTC
From: Larry Moore
Topic: 4333 Message: 4333

When working in a large cw pile up and split operation what is the best way to zero beat the guy on your transmit frequency to get close. I know tight filters help but in large pile ups you can blow by the working station with such a filter. I usually use the tune button but should be a faster way.

I've heard I will regret this but I have a super TS-850S sitting unused and uneeded. Original
owner, non smoker, purchased in June 1991. Serial number 20800237. Never had a
problem. Has 2.1 khz International Radio filter in 8.83 IF and 400 Hz CW filters in 8.83 and
455 IFs. Bill, K0ZL, replaced the battery (no leakage), did the NB and sidetone mods, DC-DC mod and aligned a year ago. He said if DDS chips had not failed since 91, they are not likely
to do so now. Original box, manual and service manual. Also SP-31 speaker, MC-85 and MC-50. Not used either mike in years. One issue. There was a smudge on top of the front panel. I stupidly cleaned it with alcohol and rubbed the grey paint off--so now there is a black spot. Pics available of course. Package for $800 plus shipping and insurance from 97230.

You can get pretty close by turning break-in off, so you can hit the key and listen to your sidetone without transmitting. Then shift to the transmit VFO and carefully match your sidetone to the tone of the station you want to zero beat. With a trained ear, you should be able to get wthin a few Hz. (Some musical ears can get even closer.) Switsh back to split/receive VFO and reactivate breakin and yoou should be set.

BTW, I forgot to say, I always use "fine" tuning speed on CW with
narrow filter. It makes it easier to zero beat...

Someone may have already answered this, but here goes:

1) Make sure both "RX" and "TX" are set to "A" (top row buttons)
2) Push the "A=B" button
3) Push the "B" TX button (second row)
4) You should now have the "A" RX button and the "B" TX button lit
Push the "TF-SET" button and tune the receiver around to hear where you
are going to transmit. Release the "TF-SET" button to listen on the DX
transmit frequency

5) If you'd like, now push the "F-LOCK" button. You cannot now change the
receive frequency on VFO A but you can still change your transmit
frequency by holding in the "TF-SET" button while tuning the dial.

4339. TS850SAT & outboard antennae tuner ?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-02-13 03:55:01 UTC
From: taephono
Topic: 4339 Message: 4339

Playing with my newly acquired TS850SAT the last few days, hooked it up a to my G5RV, the internal antennae tuner really does a quick & nice job tuneing down the SWR.. this is the 1st time I've used a rig with an auto tuner... about time I get with the crowd...:)

One question , I notice that the internal tuner has a problem getting down the swr to an acceptable level at a few spot, so I hooked up an outboard antennae tuner... anyone here use a similar setup?
When I'm using the external tuner should I disable the internal tuner or should I let both tuners work together to obtain the best swr?
I have been placing the outboard tuner in the thru position when the 850SATs tuner can tune the swr down to 1:1 by itself.

Spring antennae work is on the list!!

THanks for you replies,
73

If you use an external then you must NOT use ther internal and vissa versa..
What is the starting SWR at when the internal wont tune. What band.

Lane,

Hi Clint,

I think the idea is about the same in all the answers you got. I included #5 above because I often accidentally tune the dial after I've let go of the TF-SET button and then have to re-tune for the DX.

Enjoy the TS-850. It's one of the best.

BTW the engineers who designed it must've been hams, and pileup chasers to boot. Who else would've thought of still allowing you to tune the frequency on TF-SET while all other functions are locked out?

73, Zack W9SZ

Antennae is a G5RV, tunes easily on most bands, but I do notice that on a couple of the phone bands, and 18mhz the internal tuner on the TS850s cannot tune out the swr, and putting the 850S in manual tune doesn't do it either. THe external tuner does tune out the swr, so yes the swr is high at these points.

Your not alone Clint,, I have tried 18mhz using a G5RV and a Carolina Windom full size 80mtr model with the 850`s internal tuner and I have never got it tune either, but it tunes on all other bands from 160 to 10. It would be interesting to hear other reports about this.

Johnny, GM7LSI.

Antennae is a G5RV, tunes easily on most bands, but I do notice that on a couple of the phone bands, and 18mhz the internal tuner on the TS850s cannot tune out the swr, and putting the 850S in manual tune doesn't do it either. Interesting....I have a windom cut for 80m and my 850
tunes all bands. I used the data from
http://www.buxcomm.com/windom.htm to build mine.
It is up as an inverted V with the apex at about 55'.

As a note my LDG AT100-pro and 706mkIIG will tune 160m - 6m
on the same antenna.

I used a 4:1 balun from Buxcomm as well.

Topic: 4328 Message: 4345

Well Jon,,, The Windom I am using is the ready made one from Radio Works.
Thanks for the link, very interesting, looks good reading,I`m surprised they
give you so much detail, easily copied,,, even the ready made ones are cheaper
than Radio works.

Johnny

Interesting....I have a windom cut for 80m and my 850
tunes all bands. I used the data from
http://www.buxcomm.com/windom.htm to build mine.
It is up as an inverted V with the apex at about 55'.

As a note my LDG AT100-pro and 706mkIIG will tune 160m - 6m
on the same antenna.

I used a 4:1 balun from Buxcomm as well.

73,
Jon
KD5SFA

4346. windom antenna question

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-02-14 04:35:36 UTC
From: Gary ve3rin
Topic: 4346 Message: 4346

Jon KD5SFA, a question for you and others that may have built a 160 meter windom.
I am in the midst of designing a 160 meter windom / carolina windom based on the info from
http://packetradio.com/windom.htm and
http://www.radioworks.com/ccw160.html
to use at home to compare with a full sized 160 loop that I cannot get hight on the entire
loop.
It will be mounted in an inverted V with the apex at about 50 ft.
If possible could you email me direct to find out what you did on the windom that you built
The one that I am designing will allow me to either use it as a regular windom or a Carolina
Windom. My concern is that both sites use a 4:1 ballun but I was advise that the windom may
have 400 ohm impediance instead of the 200 ohm impedience implied.
Does any body know the impedience at the feed point, in other words has any body tested for this
info.

Topic: 4339 Message: 4348

Is there a reason why not? I have been doing just that in two main
situations:

1 - I don't have antennas specifically cut for the 18 and 24 MHz bands.
I didn't want to do the mod to the rig so the receiver also goes
through the tuner, so on those bands I use an external tuner, which perks
up the receive, and the internal tuner also. It's probably not needed
but I haven't had a problem with it.

2 - I don't have an antenna that will tune to 160 and the rig itself can't
tu8ne 160 but witht he help of a tuner, it will make it. I've made some
QSO's on 160 that way.

Not ideal, but it does seem to work.

Topic: 4339 Message: 4349

The TS-850's internal tuner is of the Tee network variety - a series cap, a switched inductor to ground, then another series cap. That schematic layout gives you the widest variety of antennas that can be tuned given a small variety of component values.

However, it can not tune 50 ohms to 50 ohms - that would require the inductor to be switched out of circuit and both capacitors shorted across. It can come close.

That's why the recommendation not to use the internal tuner if you are using an external tuner, but it probably matters little.

I tend to use the internal tuner when running barefoot, and have an external tuner which i use when I want to run power.

I have tuning problems on 160, and for that band, I home-brew a band-specific matching network for whichever antenna I choose to designate as my 160 antenna, and use a 5V coil relay to switch the network in and out.

I don't see any risk in the way you're using your tuner.

I do it all the time using my 40m vertical on 80, when I'm too lazy
to go out and hook up the coil-hi. It makes the rig happy, and gets
some rf off the antenna on 80. By no means efficient, but it works
in leu of a good tuned situation.

Hi

I have a ts450 and recently it has developed a display problem. When you turn it on, the HELLO message or whatever frequency it is showing, the numbers appear mixed up...I have to turn it off and on couple times to get it ok again.

Have anyone experienced this problem before?

Thanks in advance

Rod

Don't wait until the battery is dead - by then, it could have leaked and damaged the PC board.

They should be replaced after 8 or 10 years, or any time the radio is serviced (it's cheap insurance)..

Paul - K2BK

It's the first thing I was check. And as Paul said, why wait, if it hasn't leaked already it would be a good time to do it anyway. Due to the battery's positioning on the digital board (I think it is the same as the 850)you may want to mount it elsewhere so it is easier to get at next time. I mounted mine under the little hatch on the top cover. My 850 started to go flakey, the S-meter quit working, the slope tuning wouldn't work, sometimes it would lock in TX. Things you wouldn't expect to be the battery. I put a new one in and haven't had a problem since.

Yes,

I will do that...it also has developed a little off frequency as you go high on the bands...

Any suggestion and pics of those who have done it? Im thinking about getting a old computer motherboard battery holder and place it some where in the case and pull the wires from the board...so next time it goes dead, just flip the battery and put a new in and also, keep it inside a little plastic bag, in case the new one leaks, which I believe it would not last as much as the original one.

Rod

It's the first thing I was check. And as Paul said, why wait, if it hasn't leaked already it would be a good time to do it anyway. Due to the battery's positioning on the digital board (I think it is the same as the 850)you may want to mount it elsewhere so it is easier to get at next time. I mounted mine under the little hatch on the top cover. My 850 started to go flakey, the S-meter quit working, the slope tuning wouldn't work, sometimes it would lock in TX. Things you wouldn't expect to be the battery. I put a new one in and haven't had a problem since.

Max

Hi Guys.

I had wanted to get one of the battery holders that hold the battery and
it slips in and out.

Radio shack used to sell them, but no more.

I tried to find them on the web, and all I could find was volume
distributors that sold in lots of xxx for $30+

Do any of you guys know of a source of these coin type battery holders,
cuz I'm going into my 850 soon for mods, and would like to do a remote
battery holder while I'm in it.

I also see the battery available at just about all the swaps I go to in mich/ohio/and ontario

cr2032 and the socket from an old computer mother board IS a good idea. As far as using the battery from the computer, while it would get you by in a pinch, isnt the battery sometimes as old as the original.

> > Do any of you guys know of a source of these coin type battery
>holders,

I'm using the CR2032 size to replace them in the 850's - here are some sources-

http://www.mcmelectronics.com - part # 29-1675 - $.70

http://www.mouser.com/ - part # 614-hu2032lf - .$82

http://www.digikey.com/ - part # BA2032-ND - $1.03

If you're going to attempt mounting the holder in the thru holes where the old
battery was located, I'd highly recommend not using a used motherboard holder,
as the thru holes are pretty small (in the 850). Alternatively, you
can solder pigtails
to the mounting legs, insulate them with tape and mount in a more
convenient location.
When doing this, I use a couple ferrite beads on the pigtails for good measure.

4370. TS-690S using VFO A & B for split?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-02-21 00:33:59 UTC
From: Paul N. Gayet AA1SU
Topic: 4370 Message: 4370

Hi Clint, Zach, et al,
Thanks for asking the question about working split operation. I too had been struggling with that on occasion. It's one of those things that I read over quickly in the manual at the time. I have a TS-690S and the instructions provided match almost exactly. Even locking the frequency and looking to see where the DX is listening with the TF button works the same! This comes in handy to see if I'm even close. I feel silly that I forgot about the A=B Button. I kept manually entering the frequency from other bands.

I used NIMM Logger for the first time this weekend in the ARRL CW DX Contest. The RIG control allows for SPLIT operation, with a little learning curve. It's just amazing what smart Hams will put out there on the web for free! The same goes for Ham Radio Deluxe for RIG control. Both are high quality programs available for free. Sure wish Kentrol was free. I can't even get the DEMO version to open up in the computer. I think there is a problem with the software, but I'm not too worried about it.

While I'm thinking about it, what are the short cuts for setting up the memories? It's another part of the manual that I just glazed over. :-)

4371. battery holder

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-02-21 20:16:11 UTC
From: john rogers
Topic: 4371 Message: 4371

I used a battery holder from an old motherboard when replacing my battery in the 850. I clipped the mounting tabs off the old battery in the 850 as close to the battery as possible. I formed them to align with the tabs on the new holder and soldered them together, That way I did not have to remove the circuit board to get behind it and also didn't risk messing up the circuit traces. It has been working great.

Yes - go to http://www.mods.dk and click "Kenwood" on the main menu, then click "TS-450" on the right, then click "General Coverage Transmission Modification for the TS-450 and TS-690".

I think I'd rather unsolder the chip diode D27 than cut it. Bt that's my preference.

4374. Recommend shop to replace TS-850 battery (& modify?)

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-02-22 01:19:50 UTC
From: radiok3pi
Topic: 4374 Message: 4374

Hello,

My TS-850S is 10 yrs old. No problems yet but I guess I need to replace the battery to be on the safe side.

I'm not going to be able to do the job myself. I am wondering if any group members can recommend someone who can do this and perhaps do a mod to put the battery holder in an easier (and safer) location.

Is there a general consensus on how often the battery should be changed?

Thanks & 73

I'm the original owner of my 850.
The serial number starts with #4... I don't remember what your a bought it, but '93/'94 seems about right..
My battery has not been changed, but I think I'm living on borrowed time, cuz when they go, they leak and corrode the circuit board.
I have heard that 10 to 12 years is pushing it, and once I put the battery holder in, I will change it every 5 years.

Hi Paul,
With the help of folks on this group I was able to use
the split function quickly to work 3Y0X and other dx
over the last 2 weeks ... I have N1MM loaded on my
computer, but haven't jumped into all of it's
functinality just yet. I just installed a new
Soundcard in my PC, so I hope to soon get on the
digital modes, and computer rig control.

May I reccomend the DXLab suite of programs ... these
are all free, and the support is user driven.

The only MARS mod that I know of on the 850 opens it up to transmit just about anywhere. Make sure you are in USB and on one of the correct center frequencies, lower your power and go for it! I entered the frequencies into memories on my 850.

The mod that I know of opens up transmit to the entire HF spectrum. I think bottom limit ia 1600 kHz. I use mine routinely on 60 meters and sometimes as an IF rig on 22 MHz with a transverter with an oddball IF.

Give it a try into a dummy load and see if it's putting out power on 5 MHz.

If you clipped D9, to open it up, it will transmit anywhere between
1.8 - 30 Mhz.

I lost TX power yesterday. RX is fine. Inspected the carrier board
and found C1 had leaked and replaced it but still no power. There were
several other 10 micro F capacitors on the carrier board that looked
like they had leaked but not as freshly as C1. Before I replaced C1
on carrier board I still had the "on air" light coming on but now it
doesn't. Any suggestions on where to start looking for the problem?
Thanks.

From: max_ve3tmt
Topic: 4386 Message: 4388

Measure the TXB and RXB lines. On the IF board down near the front you will see a couple of solder pads. One is labelled TXB and another RXB. These pads should have 8V on them during transmit and receive respectively. Meaure these pads first. This will tell us if the radio is generating the proper switching voltages. The same thing happened to my 850 and it turned out to be the TRX board. It is a small sub-board on the IF board near the back in a row of 3 or 4. It was not generating the TXB voltage. I put a new board in and it has worked fine since.

1. TS850: low TX Power and lo RX sensivity
From: "flusswandler"

I can't guide you to the components but suggest that this is a perfect symptom to use "freeze mist" for troubleshooting. Take the covers off and let it warm up. I would suspect a regulator IC for starters. Alternately slowly work the freeze mist across the circuit boards until the symptom goes away (receive returns). Then use short shots to localize the temp sensitive component.

Good luck, John

Cut D9. Be sure to cut the right thing! First time I tried it, I was in a hurry and removed a surface-mount resistor. Then, I had to find one and replace it. The diode lead is easy to clip once you find it.

It's a little more work, but I unsoldered one end of the diode and left it hanging above the board. That way, I can restore it easily if I ever wish to. I may or may not do that if I ever decide to sell the rig (which is also highly unlikely - what a great radio!)

Good idea. No use putting it back into a tough-to-get-to location where it can potentially leak the next time. Put it in an easy to get to spot and be sure to write the date you replaced the battery on a piece of tape and put it on the back of the radio. Ten years from now, it will take you 5 minutes and $2 to replace the battery. <g>

73
Roy
AD6ZU

P.S. Ferrite beads are a good idea, but I don't think they are really necessary since the wires are simply carrying DC and in use when the radio is turned off. Just twist the wires.

I placed my battery just underneath the filter access door on top of
the radio. Where the voice unit should be. To replace the battery
all I will need to do is open the door and snap in the replacement.
It couldn't be easier.

Topic: 4397 Message: 4397

Yes, indirectly there is. Pull up the web page for the 60 meter modification from mods.dk. The battery is clearly shown behind the front panel circuit board. It☐s the large quarter size but correct me if wrong, I think it is soldered in.

Top, bottom panels must be removed. Sorry, but I forgot if the battery was on the left or right front. But at 14 years old now, I'm still on the original so..... ?

From: "Tom Osborne" <w7why@...t>
Subject: Changing battery in TS 450SAT

Hi all

Is there a site to show how to change the battery in my TS-450SAT? Been seeing the posts about batteries leaking and though I
should change mine. Did a google but didn't find much. My radio has
started to come on slow. When cold, I turn it on and it takes 1-2 seconds
for the display to come on. Never did that before. Thanks and 73

Tom W7WHY

Hi

I just did it on mine...The battery was fine, 3.28 volts even after 12 years!! So I just relocated it to a easier place and wrapped it on a plastic bag in case it leaks....Quite easy to do, but you need some skills...I have some pictures I took in case you need...

73

Rod

4402. TS-850 Intermittent Output Problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-05 20:50:52 UTC
From: Daniel
Topic: 4402 Message: 4402

Hi Everyone,
I have a TS-850 and it has developed a problem where when I transmit, it will key up then the power will jump down to nothing, then gradually come back up and it sometimes will repeat this while keyed and others it stays with full output. Anyone had this problem and/or know what to do about it?? It does NOT appear to be a standing wave issue, or RFI.

HELP, cuz I love this rig and want it 100% ASAP!

Thanks,
Daniel N9WX

4403. Re: [TS-850_450_690] TS-850 Intermittent Output Problem

From: Gary ve3rin
Topic: 4402 Message: 4403

That sound exactly like the problem I had on my ts850.
My tech just repaired 2 others plus mine with the exact same problem. If I understood his explanation this is what I believe he said.
C1 on the carrier oscellator board which is a 47 mf @ 16 volt electrolytic cap that leaked and created a pocket under it that carbonized and shorted and damaged the RBX line. The carbon pocket had to be scraped out and the RXB line repaired. Also L15 on the PLL board had to be replaced.
Hope this helps.
I am not a tech and don't get into the insides of any radio.
Gary ve3rin

snip
this is the problem i listed about two months ago . all 16volt caps
on the mod and carrier boards need to be checked ASAP. There is a
problem with them starting to leak. this is a problem kenwood found a
couple years back. you will see a black liquid around the caps. your
best bet is to replace all of them. there are around 28 total. I have
3 ts 850sats and took them to Rich N8UX to fix this before it became
a very costly problem.

Yes it is a very common problem, I found out the hard way.

In case anyone has not seen the effects you can see some images here of the DDS board.

http://www.gm6nx.com/850

I cannot remember now which one is the 47u which is most blamed, perhaps image 1 I think, but they should all be replaced for sure, preferably with better rated replacements (I used Nichicon UT series for the last one I did).

4406. Re: TS-850 Intermittent Output Problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-06 05:00:32 UTC
From: Richard Ferch
Topic: 4402 Message: 4406

Wow!

A question: Does anyone know whether the capacitor failure described here also causes the ALC voltage to change, or does it just cause dropouts in transmitted power without any effect on ALC?

The reason I ask is that there is another well-known problem with the TS-850, namely fluctuations in the negative voltage supply for ALC, which also causes sudden dips in output power and for which there is a completely different fix. Hopefully, if the capacitor problem does not cause changes in ALC you will be able to tell which problem you have just by watching the ALC voltage on the radio's meter.

73,
Rich VE3IAY

Also , another problem I have experienced on two of my 850's is the failure of the SSB monitor circuit. It sounds like listening to SSB on AM radio. No carrier insertion. The 8.830 mhz carrier for the monitor circuit also comes off the CAR board. Hmmmmm.

Makes ya' wonder.

We i spoke to a good pal of mine who is a service manager for knw last year . we talked about this cap problem and all the problems it caused. because the carrier board is one of the two boards affected by the leaky caps. you will get a great number of problems. bottom line if you have a 850. GET THE 16V. CAPS CHANGED OUT ! NOW! leaking or not. because the simply fact is they WILL leak sooner or later. they were just not a good quality cap.

The simple fix is to replace a couple of resistors on the DC-DC board.
I recently swapped out mine for 15K values and it fixed the problem.
However it has also been brought up that this is a temporary fix only
and the problem will return. I will keep my fingers crossed.

Max

Can these caps be replaced with ordinary electrolytic caps of the recommended size & voltage rating? Looking at the pictures posted by another member I haven't seen this style before. It makes me want to rip the CAR board out and replace the caps.

Max

Here are some references to consult on the ALC problem:

http://n6tr.jzap.com/850repair.html#ALC_voltage_problem
http://www.qsl.net/k0bx/ts850flu.htm
http://groups.yahoo.com/group/TS-850_450_690/files/MODIFICATIONS/DC-DC%
20CONVERTER/

I have done the same fix as Max, and so far it works just fine - but
now I'm going to have to look for and replace all those capacitors
too? Drat!

73,
Rich VE3IAY

I just installed a 500 hz CW filter in my TS-450SAT. Is there a way to adjust so there is less bass? I've never had the luxury of a narrow cw filter so maybe I just have to get used to it being so bass(ey). It works great other than noted above.

Thanks,
Scott-WY3X

Kenwood used Tantalum capacitors in those locations. Tantalum capacitors have lower ESR than electrolytic capacitors and therefore, some companies went hog-wild, using them everywhere in bypass situations.

However, they have all kinds of problems - too many spiky surge currents and they'll explode, for instance. I know a few engineers who accidentally short-circuited them to ground and got a nasty roasted burn on a finger when the cap exploded. They are also prone to leaking, if they go through temperature changes, like being in a piece of gear that's turned on for a few hours and then off when done - like a ham rig. Also, as they age, they lose the desirable low ESR characteristics.

The safety concerns with tantalums has led my last few employers to flat-out prohibit design engineers from designing them in, unless they can be contained in some sort of metal can that holds in the shrapnel.

Change 'em all to standard electrolytics. None of them are in locations that demand the superior electrical characteristics of a tantalum.

Garry - theoretical impedance is about 300 ohm but in practice 200 - 400 ohm across the bands. As Roland indicates, the 4:1 balun will do the job. Some references suggest a 6:1, which allows for greater variations by dividing actual impedance by 6 rather than 4.

Steve VK2XWL

The impedience is around 200 ohms use a 4:1 balum.

yes
those were Tantaulm caps. do they do not work well. use orange drop or
other caps. But use 25 or 50 volt instead of the 16 volt. 16 volt is too
close to the operating voltage

Last nite I installed 2 more filters in my 850S, so now all slots are
populated. Reading the user manual, I'm not sure exactly what setting
the toggle switches on the top of the rig accomplish?
I have toggle switches 1,3,4 turned on, only 2 is in the off position.
According to the manual this seems to be correct, but if you know
more specifics pass this info along?? ... :)

Thanks,
Clint - WS1V

Clint,

Switch 1 activates the 500 or 250 hz CW filter on the IF board (455
khz IF)

Switch 2 has no effect

Switch 3 actives the 270 Hz CW or 1.8 Khz SSB filter on the RF board
(8.83 Mhz IF)

Switch 4 activates the 500 Hz CW or 1.8 Khz SSB filter on the RF board
(8.83 Mhz IF)

Dan, the DC board problem is totally different. Apparantly if the supply voltage drops below a certain voltage, the ALC operates erratically. By changing the resistors on the DC board it allows the ALC function to operate properly with a lower supply voltage.

With all the postings lately, I can't help but wonder if new members think their radios are about to blow up! I would recommend the cap change to prevent any possible damage from leakage but the DC board doesn't appear on all radios. It is up to you whether you want to do the mods or not.

4438. Slightly OT....but related to 2 Great Kenwood rigs.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-09 14:06:49 UTC
From: KD5SFA
Topic: 4438 Message: 4438

For those who like the Kenwood quad band models
(TS-670 and TS-660) the TS-670 group is expanding to
include the TS-660 line as well. These are great all mode
qrp rigs with excellent receivers and many use for 6m
operation but include 3 HF bands as well.

The TS-670 was for the Japanese Novice band and there aren't
too many here in the US. The TS-660 is more numerous but there
haven't been any groups that I know of....thus we expanded the
TS-670 group to cover both models.

The TS-660 has 6m, 10m, 12m, and 15m capabilities.
The TS-670 has 6m, 10m, 15m, and 40m capabilities.

If you are interested, please feel free to join the group.

Just bought a ts-690 that had the at-450 option installed.
Unfortunately, the ribbon cable is broken. Is this a normal occurance
and does kenwood still have these parts for sale? Is there
another/better source for these cables?

Thanks for your help.

just the tantaulm v16 volt caps. they are on two boards in the rig .
they are round silver and have the voltage stamped on top.

Wayne,

The carrier board is located on the left side of the radio below where
the voice synthesizer sits. Remove the metal plate and the CAR board
is under that. It had the 4 identical DDS chips on it.

Max

4446. Carrier Board tantalum caps in the TS-850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-12 03:03:16 UTC
From: Dave
Topic: 4443 Message: 4446

Hi Everyone -

Today I opened up my TS-850 to count tantalum capacitors on the carrier board, and found ten 10uf and one 47uf, all 16v. I plan on ordering replacments from Mouser soon before they start leaking. Mine look OK for now. Are there any others in the radio that should be changed?

If you're interested, there are a few pictures at http://www.zievid.com/W6OT/TS-850/TS-850.htm. Pick "Carrier Board Caps" on the left menu, or go directly to http://www.zievid.com/W6OT/TS-850/CarrierBoardCaps.htm.

Dave,

According to the service manual there are only 6 tantalum caps on the carrier board...C33, C70, C74, C86, C90 and C104 all 4.7 uF 16V.

Topic: 4443 Message: 4448

Hmmm, interesting. The list on page 81 show the types as you list.

I was basing my notes on the eyeball survey of opening up the rig and looking at the board. The caps I pointed out match the photos John posted on March 5th the the leakage. He has them at http://www.gm6nx.com/850 and those match the ones I saw on the board.

In reading old posts I see Tony says they are on the mod board, so that's probably worth a look as well.

I guess tantalum vs. electolytics may not be the issue, and the real question is how often this type of leakage is going to occur.

4449. RE: [TS-850_450_690] Carrier Board tantalum caps in the TS-850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-12 22:41:44 UTC
From: John A. Ross
Topic: 4443 Message: 4449

Dave

Also some pictures here of the after effects of the leaking.

http://www.gm6nx.com/850

The devices are not Tantalums, although you could change them for Tantalums if you want.

I have no idea which manufacturer or series are used for the original 850 chip electrolytic, but I normally use Nichicon UT series to replace them with. These are rated 105 Deg C 2000Hr min and the 10U/35V version fits on the same footprint which the original 10U/16V ones do.

The 47U/16 I have found better to either use a 47U/25V or actually use a standard Radial electrolytic soldered to the pads and laid on its side.

Both objectives are to not only replace the parts, but upgrade and improve the spec for longevity.

There is obviously something up with these parts, chip electrolytic in mainstream are usually only 1,000 hrs load life, especially around the age of these sets and inside the enclosed space gets pretty hot. Not good planning but the difference in cost probably saved the designer $0.04 per part in the BOM. Good for the profit margin, not so good for reliability. Way of the world I guess :-(

Another member of this list (Jim) also tracked down some mouser (TTI) part numbers for UD series from Nichicon which are slightly better rated than the UT series I used, perhaps he can post the Mouser part numbers for reference.

If anyone in the UK is after any, let me know, I keep plenty around.

All best

John

>hi Dave:

I am at work an can not find my notes. but last year when i was talking
with my friend at the kenwood service center. he said there were 26 or so
of these type caps in the ts 580 on two boards. he told me if they were
not leaking now they would leak before long. they are not designed for that
type of on / off service. the cost of replacing the two boards is over 10x
the cost of replacing the caps. Rich N8UX on this list has a service info.
on this ill try to find my notes and get a correct number. but 10 on one
board and a bunch on another sounds about right.

4452. 10 uf Caps for 850 carrier board

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-14 05:23:38 UTC
From: lichfish
Topic: 4452 Message: 4452

I looked at the 10 uf caps on my carrier board and they already have started to leak. I measured the diameter of them to be about 4mm. The only 4mm caps I found in the Mouser catalog were a part number 647-UUD1E100MCL on page 535. The good news is they are only $0.54.
I'm trying to decide if I should remove the board from the radio to do the work or try to do it in place. Is there a trick to remove the ribbon cables from the boards in this radio?

Thanks for any suggestions,
Jim

Had a look at the carrier board caps on my 850 this morning. They all look fine no signs of leakage. Takes about 15 minutes, the longest part is taking out all the screws holding the cover. I plan on keeping an eye on them from time to time. In the meantime I plan to pick up a set of replacement caps.
What would a good replacement be? and where can they be picked up?
Thanks Wayne VO1TA

Jim,

Just wiggle them out slowly from side to side, and put them back in
just as carefully. Make sure the ends are lined up before you start
pushing it in or it may peel the foil connector strips.

Max

4455. 850 caps

Yahoo group: TS-850_450_690 (2006 — 2009)

After several inquiries, I'm *considering* a quantity purchase of
caps required to replace
the ones considered troublesome in the 850. They would be radial
lytics of the correct form factor required for thru hole replacement.

So just a straw poll - How many of you are comfortable doing
this work on your own? How many of you would be receptive to a group
buy of a "kit" to replace these caps? Yes, I do this work for others,
but I think that with the right amount of instruction, and given the
correct components, a lot of you could experience the satisfaction
of melting your own solder and breathing some extended life into
your 850.

If it looks viable, I would put together a capacitor kit with instructions
as detailed as possible. I would supply the labor of writing the instructions,
collating the parts, packaging and labelling for mailing. So the cost would
be just for the parts and postage. I would make this available only to
members of this list, so I would have to figure a way to verify your
membership in this group (suggestions welcome on how to achieve this).

I would buy such a kit. I've been considering replacing the caps in my 850 for a while now.

I do a lot more complicated soldering than that. I've become addicted to designing and building SMD circuits. Hopefully my eyesight will remain in good shape for a few more years.

Also, I don't think I own a piece of ham gear that I haven't modified in some way.

73, Zack W9SZ

Well, I was told back when I was young and threading broadband
xfrmers 4 inches in front of my nose that my eyesight would change
around age 40 - sure enough....

And my hair is not as dark as it once was - now I wasn't warned
about that.

Subject: [TS-850_450_690] 850 caps

After several inquiries, I'm *considering* a quantity purchase of
caps required to replace
the ones considered troublesome in the 850. They would be radial
lytics of the correct form factor required for thru hole replacement.

So just a straw poll - How many of you are comfortable doing
this work on your own? How many of you would be receptive to a group
buy of a "kit" to replace these caps? Yes, I do this work for others,
but I think that with the right amount of instruction, and given the
correct components, a lot of you could experience the satisfaction
of melting your own solder and breathing some extended life into
your 850.

If it looks viable, I would put together a capacitor kit with instructions
as detailed as possible. I would supply the labor of writing the instructions,
collating the parts, packaging and labelling for mailing. So the cost would
be just for the parts and postage. I would make this available only to
members of this list, so I would have to figure a way to verify your
membership in this group (suggestions welcome on how to achieve this).

Rich:

I would also like a kit for my TS-850. Hate to use the reflector to
communicate this, but it would seem to be the easiest way for you to
confirm that I am a member of this group, right?

Rich,

I would like 2 kits - I have had some SMD training! Sounds like a
great idea - hopefully this will lead to other kits to improve the durability
of our 850s! Please let me know how much!

Thanks and 73

Hi Rich,

Yes, definitely interested in a set of caps. Have almost finished a re-build (picked mine up after being written off by insurance company, following lightening surge), so before realigning, this "preventative maintenance" would be invaluable.

While I'm in VK land, I have a Chicago-based friend who regularly visits VK-land, so can organise "local" shipping if it makes life any easier. Can organise payment in US$s this way too.

Guess the only way I can prove my membership of the list is by referring to earlier messages I posted for "Help!" when I started the re-build - early '05 from memory.

Many thanks for the kind offer to run with this - most appreciated.

Cheers
Steve

Jim

The footprints for the SMT caps on the Kenwood boards are quite generous, you can usually get away with 5mm can size without too much trouble, this allows for a little updating of the working voltage also.

Jim

$0.54, that's steep. I would have expected the cost to be at least 1/2 of that.

I think I seen some replies to a post that some-one was thinking of putting a kit together for the caps. I missed the original post for some reason.

For the Chip Electrolytics it would be possible to also use standard radial types as well, these normally have an exit pitch on the botom or 2 or 2.5mm depending on the can size, so a short crop of the leads and a couple of bends to form a T shape and they would fit onto the pads fine, might be easier than SMT soldering. Radials will certainly be cheaper than those parts from Mouser.

I probably have plenty of surplus radials I could donate (except postage) to anyone looking to put a kit together as long as they did not turn round and charge for them.

The SMT caps I can definitely get for less than $0.25 USD each for sure.
http://www.nichicon.com/english/seihin/pdfs/e-ut.pdf 10U/35V
But they come in lots of 2,000 pcs on 1 reel, but in the big way of things that's 40 people taking 50 caps each

I would not mind helping out with sourcing these chip capacitors, we keep them in stock at work anyway, but I would need to check postage rates from the UK which might be expensive.

All best

John

4480. the day everything changed...

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-15 21:29:48 UTC
From: Paul Manuel
Topic: 4452 Message: 4480

I am glad that I sold my 850 a couple of months ago before hearing about the cap problem!

Back then, the "DC/DC" board resistors were the only inevitable issue. Henceforth we are in the category of the ICOM PLL-trimmer problems. No one will give much for an 850 from now on unless these caps have been changed. Potential buyers will begin asking. Auction listings will mention the issue.

History is being made right before our eyes.

will mention the issue.

Paul,

As an owner of four 850's at one time or another I would have to
disagree with your statement. The 850's have always sold for less than
what they are really worth. I've owned many newer DSP equipped radios
that can't hold a candle to the 850 for signal and receive quality. As
for the cap replacement, it is a very easy fix to perform and one
thing I have always liked about the 850 is just how easy it is too get
at things when they do need replacing. Try taking an FT900 apart to
mod the tuner!!! That was nail biting. I don't think the cap problem
will decrease the value of the 850 one bit. Look at the problems Yaesu
had with the FT9000. Have you seen their resale value lately?

Max

Hi Max,
I love the 850 just as you do. It pained me greatly to sell mine. But I know how hams like to jump on a bandwagon about these things. I do hope you are right!

I bought my '850 from ebay a few years ago. The seller said, right in
the listing, that the DC-DC board had been replaced once, but was a
few years old, so may need to be changed soon, and he also said that
the DDS chips were original, and that he had, thus far, changed only
one of the tantalum caps.

This isn't new history, it's just a reminder!

Tom,

I think what Jon is trying to say is we are getting some posts that
are including the text from the previous 4 or 5 posts in the same
thread. If you want to quote the text you are replying to that is
fine, but if readers are following the thread then they have probably
read all the "extra" anyway. I have also posted messages in the past
on the same subject.

Hi Rich,
Put me down for 2 kits of these caps.
I assume the 690 also has these caps?

Hi Tom,

Sorry you feel that way about the TS-850 and what doesn't amount to more
than a minor problem in those rigs. Everyone that I have known that has had
an 850 pretty much echoes the same sentiments about how great they are.
Don't let a little electrolytic capacitor r&r keep you away!
There's always room in my shack for another 850, no matter what kind of
shape it's in...

73,
Jack, N1JLW

4497. Cap Kit update

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-18 17:25:18 UTC
From: Rich Dailey, N8UX.
Topic: 4497 Message: 4497

Looks like there's quite the interest in a capacitor kit.
I'll give it a few more days, then I'll figure an order, and rough idea
of cost for K, VE, and dx.

Not really. Not all of them fail. The same cap (mfg) is used in
Yaesu's and Icoms. They fail there too. What are you going to do,
avoid all radios with SM caps???

Hello All,

Is it just me, or is the TS-850S one of the best radios of all time? This is a rhetorical question. With a full complement of INRAD filters installed, my 850S has a fantastic, ?crunch proof? receiver. I am curious it others here have compared it to the better offerings as of late, such as the Orion II and Pro II and Pro III as examples.

Thanks for the responses regarding recent radio offerings and the venerable 850.

Regards,

Steve ? NL7W

Dont know about the orion but the Pro2-3 are much better. It really is not a far compairison as there is 20 years of tech difference in them. Im not saying anything bad about the 850. It is a great radio but not next to a ultra modern high end radio.

Topic: 4501 Message: 4503

Until the Orion came along, the top honors for crunch-proof front-ends were the TS-850, IC-765, FT-1000D and Elecraft K2. Yaesu's second-generation FT-1000 Mk IV failed to measure up by about 15dB. The Icom IC-756ProIII fits with the later Yaesu, not the earlier one.

The DSP rigs have much more flexible IF filtering. If you're trying to squeeze out that one lone CW signal from a relatively empty band, or if you're trying to ragchew on SSB and get rid of just the exact amount of off-frequency QRM, then DSP can't be beat. However, Icom has never been able to lick a phase noise problem that's plagued them from the IC-735 days.

I've been able to plant two TS-850s on the same band, on Field Day, and use them succssfully. I have not been able to do that with IC-756ProIII's due to both the phase noise issue, and front end overload. The ProIII is a great rig in many respects, but it was not really designed for quite this level of front-end torture. The "lowly" K2 from Elecraft, however, does it fine, but the K2's IF filtering is even less flexible than the '850.

The top notch multi-multi contest stations have to use radios that survive best in harsh RF environments. To date, the '850, FT-1000D and K2 appear to be the rigs of choice. The 1000 MkIV is seeing some usage in these stations, as is the FT-920. The Orion is very quickly finding its way onto those operating desks; the IC-7800 more slowly, partially due to price. The Ten-Tec Omni has also been a popular radio for multi-multi stations; Ten-Tec arguably has the vexing phase noise issue handled better than anybody.

Topband is another harsh environment; on that band, for many years, the rig of choice was the '850, but the FT-1000D has surpassed it, due to the DSP enhancements. The ProIII never gained a foothold in that community, due to the inferior front end, despite the great IF DSP. The K2 and Orion are gaining ground on topband as well, and there are lots of Omnis on 160.

Intriguingly, some 30% of the respondents to the last poll about "what's the best topband receiver" replied, "Drake R-4C with Sherwood modifications". Hmmmm...

So, it depends on what you want. If you're into contesting, the '850 is hard to beat, and its only real competitor, at its price, is the IC-765. If you never use high-gain antennas and/or never have to pull a weak signal out from the midst of a strong pile-up, then you might prefer to sacrifice the ultimate front-end in favor of the more

flexible IF filtering afforded by IF DSP. If you want both a
bullet-proof front end AND top notch IF DSP, then the Orion and the
new FT-9000 are the only games in town, with the IC-7800 trailing a
bit, sacrificing some front-end solidness in exchange for "Tokyo by
night" dazzle.

73,

Dave W8NF

No, I would not worry about it. I am talking about hams in general. The fact that so many folks on this list seem so concerned about it made me feel as I indicated in the message. I had a bad feeling about the trend I was seeing. That's all.

Preventive maintenance is good. My TS-850 has been doing fine for several years now and it's the best radio I've owned personally, so I want it to keep on running.

It took me almost two weeks in my "spare time" to swap out all the bad parts in my TS-440S ruined by that contact cement they use on the VCO board. I'd rather not have to go through a similar ordeal with the TS-850. (I'm glad they didn't use that cement in the 850!)

When I worked in an electronics repair shop, it was a common occurrence to have to replace capacitors that were rated just slightly above the voltages placed on them, for the sake of saving a few pennies on each capacitor. (I know, if you're making thousands of units, that cost adds up ...) The things were always shorting out. DC-DC converters were particularly susceptible. Someone even made an aftermarket kit with all the parts needed to replace the failing converter in RCA VCR's. The capacitors supplied in the kit were rated at about twice the voltage of the originals.

In my own designs I tend to go with "overkill" on the rated voltages of capacitors. I haven't had a failure yet in one of my homebrew projects.

I haven't had the luxury of owning any of the newer high end radios although I did play with an FT1000D the day Albania came back on the air. Snagged ZA1A on the first call! I have however had the pleasure of owning a large variation of the "middle of the road" rigs and have always come back to the 850. I'm now on my fourth and it won't be leaving the shack any time soon. Why do I like it? My reasons are as follows, and not in any particular order...

1. No need to access menus for regular operating
2. The front panel layout is "da bomb"
3. The receiver, enough said
4. The transmit audio, enough said
5. Ease to repair if need be, everything easy to get at
6. IF slope tuning
7. True RF monitor, not just a tap off the mic amp
8. True FSK
9. An antenna tuner that really works, and works fast!
10. The radio just looks cool.

Anyone else?

4508. TS-850 : Problem power and modulation, please help me ...

Hi all,

When my 850 is in good temperature, I press to ptt microphone and talk, the power go up to 100 watts, down to 30-50 watts and go up again softly to 100 watts and the modulation is comprehensible but bad.
When it's cold it doesn't like to have this problem ...

I see this problem in sstv too.

Is someone have already this problem ?

Please help me, many thanks

4509. TS-450 & narrow SSB filter

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-20 17:36:12 UTC
From: ea2bsn
Topic: 4509 Message: 4509

Hello!

I have installed a narrow SSB filter in my TS-450. The filter is the YK-88SN-1 1.8 KHz for 8.83 MHz IF.

The problem is that when I activate the filter I have to use the IF SHIFT knob in order to get a decent audio. If I do not turn the IF SHIFT (always a quarter) the received audio sound as shifted.

Is it a problem with the filter or do I need some kind of alignment?.

Thanks for your support.

73

This is normal as 1.8 is a little narrow for SSB. Turning the IF helps compensate for this. Mine works the same way.

Is the ALC indication going very high when the power drops? If so,
this is an indcation of the "famous" DC-DC converter problem, also
known as the "ALC problem". Documentation here:

http://n6tr.jzap.com/850repair.html

Look down the page for "Common problems on the 850 and possible
cures". It's the first problem listed.

Is there an internal alignment adjustment for the IF Shift? My service manual doesn't seem to make that very clear, and there are a few pots on the circuit boards that aren't listed as to their functions.

Hi Dave,

Many thanks for your quickly reply.

Yes the ALC indication going to the maximum when the power drops to about 50 watts. After the power go up softly to 100 watts and the ALC indication go down to the normal . But the modulation is a little bad and sometimes any qrm in the SP-31...

Many thanks for the nice link, tomorrow I will buy transistors : two BC547 , one BC557 and two diodes 1N4148 (see the mod here http://www.qsl.net/k0bx/TS-850ALC2.htm)

I hope that fix the problem.

A big thanks,

Regards

From: dagivens
Topic: 4517 Message: 4517

Rich,

Please add me to the list for a kit of 850 caps. I appreciate you doing this, thanks.

Sounds like the infamous DC-DC board issue. As quoted on another site:

ALC voltage problem (from NB1B): The problem manifested itself as varying power output; if you close the key and watch the power meter, it will go from zero to full output and then back to zero output on about a 5 second cycle. What is happening is easy to see by using an external wattmeter and putting the 850 meter on ALC; the ALC goes from zero to max as the power goes from max to zero. This was explained to me by the guy that diagnosed and fixed the problem. The circuit that is bad is one that has resistors, transistors, and capacitors all on a multi-legged component. It is a multivibrator that develops a voltage that is then rectified and amplified and is used as the ALC voltage.

Something goes bad and it causes a very slow oscillation, and the ALC voltage swings from zero to max and back again, causing the power to oscillate in step. I don't know how much the part cost, but the guy spent 8 hours on the radio (not a Kenwood Factory Rep) before he could figure out what was going on. Since then, I have seen probably a dozen postings from hams that have had the identical problem that have sought an explanation for it.

Also, K0BX reports the same problem: The DC-DC board X59-1100-00 fails and causes the power output to go up and down. First time I had Kenwood replace it for a total cost of $150.00. This past December I replaced it my self for a cost of about $14.00 with shipping. I have a detailed description on how to do this repair on my webpage and then go to TS850S ALC/TX PROBLEM.

And this from K2UT: One of my 850s had the DC-DC board replaced about 18 months ago after experiencing the usual problem: output power

oscillating back and forth. Had it repaired and the rig was working great. Then, about 4 months ago, a new
problem appeared. I had a couple DC-DC boards on-hand for repairs, but this didn't seem to fit the usual pattern.

When the rig was on for a while but not transmitting, the first SSB transmission would peg the ALC meter for a couple seconds with no output. It would then drift back down to a normal level, and output power would rise. Transmitting
again within 10 seconds would work fine; no ALC problem. After about 15 seconds, the cycle would repeat.

I called Kenwood and suggested the DC-DC board, but the repair tech didn't think it could be the problem. Rig went back to Kenwood for repair. The problem? The f***ing DC-DC board! $135 and six weeks spent when I could
have repaired it myself.

4519. Replacement capacitor kit...

Rich,

You'll find me in the members list. Seldom post anything,
but appreciate the support I get from reading the mail.

I have an 850 that has been sitting on my desktop for 12
or 13 years. Thus, I'd like insurance in the form of a
capacitor kit.

I also have a TS-790. Might I need more of these capacitors?
If so, then two kits, please.

Clint WS1V,
Sorry, just read your 02/22 reply to my 02/22 post. Thanks for the link to the DXLab suite of programs . I think I'll have fun checking out the programs!

I plan to use N1MM this weekend for WPX SSB. I was hoping to figure out how to record my voice for each number and letter to use in the call sign and exchange fields, but have not figured it out just yet. I figure it would keep the peace better in the house :-). Oh well, I have F1 & F4 loaded, so that's a good start.

4523. TS-850 Front Panel Replacement

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-24 04:40:25 UTC
From: alamar_r
Topic: 4523 Message: 4523

Has anyone in the group ever replaced the front panel on their TS-850? Some years back, a certain SIL of mine accidently sprayed some WD-40 on the front of my TS-850/PS-52 while my XYL & I were on vacation. It left some rather ugly spots, especially on the PS-52. I ordered replacement front panels from Pacific Coast Parts after discovering the spots were permanent. I replaced the PS-52 panel years ago but have put off replacement of the TS-850 panel. If anyone has any words of wisdom for me before I dive in, I would appreciate hearing them.

Thanks,
Alan, KDS5R

Alan,

I have done it twice. It really isn't hard to do as long as you take your time. I bought the one on my radio now used as I was told by East Coast Transistor they are no longer making them and there were none to be found except on the used market. Post an add on QTH.com. I did and received an e-mail a day later from a fellow parting out an 850. The panel looks almost new. I kept the display glass off my old one just in case.

Swapping the panel is easy. Stand the radio up on a floor or tabletop with the front panel facing up. You have to remove the covers, then the four screws that hold the panel in place. On the top and bottom of the panel are two little plastic snaps that lock it in place. You have to gently lift them one at time and wiggle the panel up towards you. Obviously you have to remove the knobs and VFO knob. Now would be a good time to soak them in dish soap and water and give them a good cleaning.

The panel may or may not come with the buttons attached. Kenwood sold them both ways. All of the buttons in the "filter" section and under the "FUNCTION" area are attached to the panel with a foam wafer between them. If this foam gets torn the buttons will fall out from the panel if you turn the radio upside down. After the knobs are off and the little tabs pulled up, simply pull the panel off towards you in an upward direction. By standing the radio up, hopefully all the little buttons that are attached to the front chasis will stay in place. When you put the new panel back on, make sure all the switches and buttons line up with their respective holes. Use a toothpick to center them as you slowly push the new panel back on. In fact it takes more time removing all the screws than it does swapping panels.

Good luck,

Max VE3TMT

Alan,

If you damage the foam pieces that hold the buttons in they are
available fairly cheaply from the Kenwood suppliers.

All,

I have noticed that several of the problems with the TS-850s that have
been discussed here on the reflector also apply to the TS-690s.

I have two (2) TS-690s and my questions are; should I be concerned with the
same capacitor and DC-DC Converter problems that the TS-850 has and if so
should I be proactive in replacing these parts. I know that this question
had been asked about the cap problem a couple of times with no responses,
and I am wondering if the DC-DC problem could be/become an issue also. One
other question. I know that this is NOT a TS-790 reflector, but I have two
(2) TS-790s, one working and one on the bench recovering from lighting.
These TS-790s are about the same age as my TS-690s are, and I am wondering,
as Dan is, whether are not this could become an issue with these radios
also. I know that these were rhetorical questions, but I have not seen any
replies yet, even after several posts by others.

Alan,

I have done it twice. It really isn't hard to do as long as you take
your time. I bought the one on my radio now used as I was told by East
Coast Transistor they are no longer making them and there were none to

be found except on the used market. Post an add on QTH.com. I did and received an e-mail a day later from a fellow parting out an 850. The panel looks almost new. I kept the display glass off my old one just in case.

Swapping the panel is easy. Stand the radio up on a floor or tabletop with the front panel facing up. You have to remove the covers, then the four screws that hold the panel in place. On the top and bottom of the panel are two little plastic snaps that lock it in place. You have to gently lift them one at time and wiggle the panel up towards you. Obviously you have to remove the knobs and VFO knob. Now would be a good time to soak them in dish soap and water and give them a good cleaning.

The panel may or may not come with the buttons attached. Kenwood sold them both ways. All of the buttons in the "filter" section and under the "FUNCTION" area are attached to the panel with a foam wafer between them. If this foam gets torn the buttons will fall out from the panel if you turn the radio upside down. After the knobs are off and the little tabs pulled up, simply pull the panel off towards you in an upward direction. By standing the radio up, hopefully all the little buttons that are attached to the front chasis will stay in place. When you put the new panel back on, make sure all the switches and buttons line up with their respective holes. Use a toothpick to center them as you slowly push the new panel back on. In fact it takes more time removing all the screws than it does swapping panels.

Good luck,

Max VE3TMT

4534. 850 Low Receive

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-25 03:50:39 UTC
From: ah6rr1
Topic: 4534 Message: 4534

Well I did it. I had my amp on today and it made a loud pop and it killed the receiver on the 850. A normal s9+20 signal is now a s2 ouch! I am not the most technically inclined but looking at the D16 lighting protection diode it had a faint white line on the antenna side and I get a reading of 49.9K ohms across it. Is this normal? or could this be the problem? Can I jump across it to see if the receive comes up? Or should I send it off for repair? any help will do.

Thanks
Roland AH6RR

4535. 850 Carrier Board Caps

Topic: 4534 Message: 4536

I looked at past messages and found the what to look for. I clipped one end off of d16 and the receive came back to normal. I have one on order. I had a tube blow in the amp and that caused a surge in the coax. No to find why the tube failed. Thank God that the GI-7B tubes are cheap.

73
Roland
P.S. Thanks Bill your hint for another post led me to clip the diode insted of putting a jumper.

4538. Re: 850 Carrier Board Caps

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-03-27 18:06:07 UTC
From: Dave
Topic: 4535 Message: 4538

The Kenwood "problem" originated with using Tantalum caps where they should have used ordinary electrolytics.

As I have studied online information sources, I have come across a new problem in plain old electrolytics. It surfaced originally on PC motherboards and in PC power supplies, but since it is caused by an incorrect chemical formulation in electrolytic capacitors, it will happen in any product using "bad capacitors".

In short, your list of "good capacitor manufacturers" is:

Nichicon (I've always had good luck with them, and I'm allowed to design them into hi-rel military gear
Panasonic
Sanyo
United Chemi-Con
Nippon Chemi-Con

I've used all of the above. There are other brands that have been good at times and bad at times. The suspected cause is industrial espionage - someone at one capacitor factory stole a formula from another capacitor factory, but got the formula wrong. Then it spread to others.

For a good intro to the problem, causes and effects, look up the Wikipedia entry for "capacitor plague":

http://en.wikipedia.org/wiki/Capacitor_plague

That article links you to industry websites that discuss the problem.

Electrolytic capacitors are very complicated devices. An earlier problem was more contained. Large can (computer grade) electrolytics made in 1988 and early 1989 were manufactured with very mild chlorine contamination. After some years of service, and more often in high ripple-current applications, the internal aluminum foil contacts would erode away and the cap would go open circuit. Unfortunately, my employer of the period had shipped some 1000 RF power amps, any of which could have had "bad capacitors". We eventually did a "recall" of the high voltage filter board in every single amplifier. We chucked out every cap with a 1988 or 1989 date code. It affected about 30% of the boards. Alas, because the boards had been in amps already, they were no longer allowed to be used in new amps, but could be used as "repair exchange" assemblies. We designed the amps so ruggedly that in the ten year commercial usage of the amps, only two high voltage filter boards ever went bad in usage. So we were sitting on some $80,000 of perfectly good, but not usable material - e.g.

"scrap". The brands involved at that time were Philips and Mallory,
as they both manufactured caps in the same factory.

Hi Dave -

Can you confirm there also is a problem with the tantalum caps used in the 850? Others have reported problems with the electrolytics, not tantalum. John earlier sent photos of leaking electrolytics, so that's what I've understood was the issue.

I was confused about this earlier, so I'm really trying to sort this out.

Thanks,

- Dave

Isn't C1 on the CAR board a tantalum? That's how it was originally reported to me - but I honestly did not look it up in the Kenwood Service manual!

Also, the clear, acidic goo that came out of my C1 was consistent with the goo I've seen oozing from tantalum caps. When I've seen electrolytic caps leak, the stuff dries up and crystalizes fairly quickly.

However, I am open to being corrected on the matter!

C1 is a 47uf electrolytic. C4, C8, C10, C13, C15, C20, C22, C25, C27 and C66 are similar 10uf electrolytics of the same make and series that probably have the same problems with leakage. Your notes about the chemical problems making caps explains a lot, these just seem to be a bad batch.

FWIW, I replaced mine this past weekend with the following units from Mouser:

647-UUD1E470MCL - 47uf, 25v
647-UUD1E220MCL - 22uf, 25v (Mouser didn't have 10uf in stock)

The data sheet is linked from http://www.mouser.com/access/?pn=647-UUD1E470MCL. I picked these because they seemed to have higher temp range and are SMD to match the ones it replaced. These are 25v which hopefully will give them a bit more headroom. They aren't cheap, but I think they'll do the job.

I'm not sure voltage is really an issue; the schematic (pg 164 in the service manual) shows all the 10uf caps on 5v lines. They are used on the chip +v inputs; I belive to smooth out the supply and prevent spikes with all the digital switching. C1 is at a bit higher voltage, over 7v, but that's still well under the 16v original rating. Going to a higher capacitance (22uf vs 10uf) here shoudn't be an issue.

The 22uf SMD caps are slightly larger than the originals, but it wasn't a problem. I messed up a few pads removing some of the first caps, but that taught me to be patient and gentle when loosening the old ones. After they come off, I cleaned and tinned the pads. Before soldering the new ones on, I bent the leads down slightly, then held them onto the pads and re-melted the solder and made sure if flowed onto the leads.

Anyway, it's all back together and working the way it should. I sure feels good to see the rig come alive and find out that I didn't break it ...

I have yet to see a Tantalum cap in the 850 carrier unit contrary to the service manual. C1 leaking is very common (at least to me). I have only seen one board that needed all of them replaced. I have heard the chemical explanation before and it makes sense.

Best is just to replace C1 and look at the others. Look closely at the solder connections, they should be shiny, if dull the cap is probably leaking. If in doubt stick a soldering iron to the connection, your nose will let you know if it has leaked.

4543. TS 450SAT Audio Problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-02 16:07:23 UTC
From: Tom Osborne
Topic: 4543 Message: 4543

Hi All

My TS 450SAT is developing an audio problem on transmit. Sometimes when it comes on, it works fine. Then the transmit audio goes away.
It works on FSK, CW, and FM, but no audio on AM or SSB. Any ideas? Thanks and 73
Tom W7WHY

4544. TS-850 display problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-02 19:32:20 UTC
From: José V. Gavilá
Topic: 3022 Message: 4544

Hello!

I have a TS-850 in the workbench with a serious display problem... all the right side (full display except the S-meter) shows arbitrary information, with most of the elements lit. It changes with dial (and radio works fine) but display is always nonsense.

I have checked the service manual and that part of the display is controlled by a dedicate integrated circuit. It is so my first suspect, as data lines are shared with S-meter part controller and it works fine. But, just in case, I wonder if there is another fault which could lead to that erratic display.

In case it is the large IC, is there somebody with a parts unit TS-850 willing to sell me the display board?

Thanks!

JOSE

4545. TS 850 power varies at transmit in CW??

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-02 20:05:37 UTC
From: n9rou
Topic: 4545 Message: 4545

My beloved TS 850 is acting strange. I use it almost only for receiving daily. I am the original owner and the serial number is in the 5 million range. Today I was checking SWR on the dipole connected to it and I put into CW mode and hit the rec/send key to transmit with antenna tuner off. Well the power kept varying from about 100 to 60 watts going down and up. The SWR was flat and did not change as the power varied. I tried with the antenna tuner on and the same thing happened. I tried 10, 15, and 40 meters and the same happened. Happened in FSK also. I lowered the power to around 25 watts and the same behaviour continued. Anyone have an idea what is going on. I suppose it is a good time to send it to the factory for checkup and battery change anyhow. Thanks for any advice. --- Steve KK9ZZ

PS. Don't know how many have seen this but Rob Sherwood has updated his reciever tests to include the TS 850 with Inrad 400 filters. Close in dynamic range shows as an impressive 77 at 2 KHZ. That is not bad for a general recover receiver with no special roofing filter. The Icom 756 PROIII with the "improved" roofing filter had 69 at 2 KHZ which is significantly lower. See the link below if interested.

Topic: 4546 Message: 4546

Hello group I need some advice as to what might be wrong with my 850.

Just recently my 850 started acting crazy on me and I don't think its antenna problems.
For one it wont hold a tune on my G5RV. I put it in CW mode and watch it on a external meter and it will show the full 100 watt output, then abt 1.5 minutes later, it will loose power output to about 10 watts, and SWR will go high, then a little while later then it goes back to full power out.

Today I took the auto-tuner out of line and used a external tuner and put it back in CW mode and tuned the same antenna down to 1.3-1 SWR.

Any ideas or suggestions on what might be going out or possibily have went out on the 850??

Someone told me it was antenna problems, but after using a external tuner I don't think its antenna problems.

73,
Brian

Jose, first check the digital unit for a leaking battery. Several data lines run under the battery and I have had them damaged and mess up the display only. Then check the data lines at the display unit using a scope.

Hello Clif and all the List,

I was just about to send a message as I have already fixed it :-)!!!

I have looked with the oscilloscope to DATA, CLOCK and ENABLE lines for the 'faulty' IC and, yes, CLOCK was missing!. As CLOCK is the same for both ICs (the one which controls the S-METER and the other unit), it was evident something was not right... so I have removed the DISPLAY UNIT and there was a leaking capacitor (470uF/16V). It had corroded a PCB track which, _casually_, was the CLOCK line.

So, once I have replaced it with a piece of wirewrapping wire, it has worked fine :-)!!!

It is nice to end a weekend with a nice repair :-)

Regards,

JOSE

4550. Leaky C1 on CAR board

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-05 02:41:39 UTC
From: max_ve3tmt
Topic: 4550 Message: 4550

Just out of curiousity I decided to inspect my CAR board for a leaky cap. Well my C1 has leaked. I have uploaded a picture into the "SERVICE" folder in the Photo section for all to see. I wanted to check because sometime ago my SSB monitor stopped worked properly. I could hear the audio but it sound like I was listening on AM, i.e. the carrier was missing. The carrier for the monitor is generated on this board so I decided to see if the cap was leaking and was this the source of my problems.

Looking at the schematic, C1 runs from the 8V line to ground. This is well below the 16V rating of the cap, I guess it just leaks from age?? My 850 is in the 20 mil range. I measured 7.63V going into the cap and the same after the cap going into the IC8 5V regulator. The regulator measures exactly 5V out.

Obviously there may be some damage to the board, but I'm curious if the leaky cap could cause the monitor problem. I could see if the leak etched the trace away but that doesn't appear to be the case. Can it be changed with a standard 47uf 25V electrolytic? and could this be the source of the problem?

Max

4551. Re: Leaky C1 on CAR board

Yahoo group: TS-850_450_690 (2006 — 2009)

From: max_ve3tmt
Topic: 4550 Message: 4551

Upon further inspection...

I removed C1. The trace under the cap was badly corroded. This trace carries 8V on TX through R53 to the MCAR circuits. I measured for continuity on the top side of the board before the corrosion to the other side after the solder-thru hole. No go. The solder thru hole was also badly corroded on the top side. I soldered a wire jumper thru the hole and used the wire as a trace back to the good side and now have a complete circuit. Sure wish I had my new bi-focals to finish this job. I think this is why I lost the carrier signal. Now to reverse my monitor mods to get true RF monitoring Hmmmmm.....

4553. TS-850 Low Output

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-05 18:19:27 UTC
From: Brian
Topic: 4553 Message: 4553

My newly purchased TS-850 has a problem with power output. Output varies according to band. On 160 meters, its only 25 watts. On 80 meters, it starts at 50 watts and gradually rises to close to 100 after a few seconds. On 20 meters, it's 75 watts. 17-10 meters its only 25 watts.

On all bands output seems to start lower and then rise slightly after 5 seconds or so, but the effect is much more pronounced on 80 meters.

Is this the DC-DC board problem? I'm not sure, it doesn't seem to match the descriptions I've found... There does not seem to be any drop in output after a while, it rises and stays steady.

Measurements were taken with the ATU disabled, using a dummy load and a known accurate meter.

Any ideas? There's nobody in eastern ontario that I know of that would repair it and I'm not comfortable shipping it somewhere if it's going to cost me a fortune to repair, so I'd like to know if I should take it back to the guy and demand a refund.

Go to the filter unit and with ohmeter in hand figure out which relay
is stuck. Go thru the bands and confirm operation of each. Usually the
10m relay.

Hi Clif, thanks very much for your reply. It appears the problem has corrected itself. I suppose one might want to translate that as "user error", but I admit nothing :)

Actually, I'm not sure what it was. All I know is I have full output on CW now, and I didn't before. I'm sure the rig was not used for some time before I brought it home, if it was indeed a stuck relay it may have become "unstuck" with a bit of use I suppose. All seems well now. I shall keep an eye on it.

Thanks very much.

4557. TS-450S low receive sensitivity

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-08 04:49:27 UTC
From: Vince Cothran
Topic: 4557 Message: 4557

Greetings to the group,

After a number of years of inactivity in the hobby, I just purchased a TS-450S that has turned out to have dismal sensitivity on all frequencies below 21.5MHz. I used a signal generator at work to apply a 50uV (S9) signal at various frequencies from 800KHz to 30+MHz. Frequencies below 21.5MHz produced S2-S3 readings, with frequencies above 21.5MHz consistantly producing S meter readings of S9+15db. This was with the attenuator and AIP turned off.

Another red flag about this rig is a strong birdie dead on 10MHz. Is this normal? Other than that, she cleaned up nicely and puts out ~125W on all bands, with good clean sounding audio.

I just foound this group today and have read the posts about bad or leaky switching diodes on the RF board. Is this the most likely cause of my sensitivity problem. If so, does my data provide enough info to guess which one to check first and could someone suggest the best source of replacements.

Thanks in advance and 73,
Vince - KK4NH

I have an odd problem with my TS-850SAT and am hoping that one of the group members might have a suggestion. I have a Kenwood MC-60a that I have been using on my TS-430S for some time that works well and I have even had comments about the audio quality. I also have the stock mic, the MC43s that works fine on both radios. My problem is that when I connect the MC-60a to the TS-850SAT, everytime I hit the PTT, there is a distinct Hsss coming from the microphone element. I usually operate with head phones, and the first time I heard the noise, I ripped off the headphone to try to find out what I was hearing. I knew it was NOT in the headphone. During one attempted QSO, I heard the person I called CQ to, state on the air that he has never heard that kind of noise before! When I plugged the MC-43s back into the TS-850SAT, everything was fine. I have tried the MC-60a with and without the preamp. I have tried with and without batteries. I even disconnected the base cord, and plugged in the cord directly from the radio to the microphone thereby eliminating any circuit in the base. In all configurations the same Hssss noice comes from the MC-60a when used on the TS-850SAT. In all configurations on the TS-430s, it works fine!! I love this microphone, and want to use it on the TS-850SAT, but I am stumped. I would appreciate any suggestions. 73 Bill W1WRH

Does it have batterys installed. Is the switch set to 50K or 500ohms. It should not have batterys installed. Turn on the mic amp and set switch to 50K. Turm mic gain on radio down to around 9:00 position.

Hope this helps

Lane,
I had removed the batteries. Currently I have the switch set to 500 ohms. The stock mc43 mic was 600 ohms. I will try your suggestion with the amp & 50 ohms and report back.

4561. Does My TS-450 Need Display Calibration or something else?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-09 12:28:10 UTC
From: ve9xyz
Topic: 4561 Message: 4561

Yesterday I had a QSO with a chap on 20 meters and he just so happened to see the spotting entry for our QSO that was automatically generated by my logging pogram. At the end of our chat he mentioned that we were on 14.254.20 and not 14.254.40 which I reported in my log.

Hmmm - maybe I need to calibrate as outlined in the back of my manual - BUT on the 75 meter band (which I spend most time on except for weekends) always sems right on - most QSOs seem to be right on XXXX.00 or XXXX.50 and sound exactly right there.

Is there an adjustment for each band? Maybe some small oscillator error grows with operating frequency and so shows up more on higher freqs?

Any suggestions appreciated.

Kevin,

There is no adjustment for the individual bands. Quite possibly it was
HIS radio showing the incorrect frequency.

Firstly, May I thank all who responded to my original question. I am pleased to say the situation has now been resolved.

When I first went around to My friend's, I had not taken any test gear with Me (external ATU, external power meter etc..). I managed to get a dummy load from another amateur locally which when connected indicated that there was possibly a fault with the internal ATU. I went round again a couple of days later with an external ATU and with this connected and the internal ATU offline the antenna tuned OK. I then increased the power out from the radio to 100% (I.E. 100watts) and was amazed to see, with and SWR of 1:1, only 8 watts going out. This then indicated problems with the PA..
I spoke on the phone to the Shop where the radio was purchased from and they agreed that it sounded like PA trouble. The Radio was returned to them and after they checked it a new TS2000 was given to My friend.. A happy outcome !!..

All I have to do now is get My TS850 display working again..

Regards to all..

Nik M5DND

Have you checked against WWV? Push the "tune" button and find out where WWV zero-beats. My rig appears to be about 8 Hz too low. I'm not going to worry about that at this time. 8 Hz isn't worth fooling with for everyday use IMO.

4567. Low output on 17m and above

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-09 18:01:56 UTC
From: dm4dx
Topic: 4567 Message: 4567

Hi all,
I am using an Kenwood TS-850s and have some problems with low output on 17m and bands above. On 20m the trx does about 80-90Watts which is ok. But for e.g. on 10m it's only 40Watts. Apart of that I believe the sensitivity isn't that good at all. Compared with a TS-50 I find it slightly worse.
After reading the group I changed the 74LS145, but no changes occured. Now I am going to change the D31. It must be somewhere on the rf-unit, isn't it? I tried to figure out where it's located but since now I didn't find it. If I don't have 2 D's, does it make sense to put in 2 new diodes like shown in the kenwood bulletin, or shall I stick to one?

If this doesn't work either I'm going to try to change the switching transistors may be this is the error that creates the low sensitivity.

So can anyone help me finding the D31? Probably any other things I can try to fix the radio?

By the way, a great group here. Fine to read.
Thanks for your help,

Chris

There is one reference oscillator for all bands. As you go up in
frequency the error becomes larger. SSB is not the place to check
error because different people hear differently.

It can be adjusted but you need a calibrated frequency counter to set
it. Joe's $50 flea market special just won't do. You are looking at a
200hz error. His radio could be off 100 and yours 100. Which one are
you going to adjust if you don't know which is off. Also the radio
will move several hundred hz from a cold turn-on as the crystal warms up.

I guess I'm trying to say I wouldn't mess with it over 200hz.

If D31 were bad it's wouldn't work. You probably have shorted diodes
in the RF filter unit. These are the diodes the '145 feeds. Use an
ohmmeter to check the diodes.

You really need a service manual find find all the diodes.

Hi Cliff,

Bill,K0ZL somewhere mentioned that low tx out can probably solved by replacing the D31. If I remember right the Kenwood news bulletin stated that this D31 is one main failure for low sensitivity, so I guess if it fails the radio should work anyhow. May be someone in here has experiences with that?!
Right now I'm going to get a service manual. I'll also check your hint about the diodes.

4573. Raspy and Varying Sidetone

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-11 20:04:44 UTC
From: John Kuklewicz N7ZN
Topic: 4573 Message: 4573

Hello,

I recently returned from a long time away from my TS-850 and have noticed some very unusual behavior of the CW sidetone.

When I first turn on the rig, and close the key (in CW mode) the sidetone has a very raspy sound. The pitch varies from normal (800Hz or so), to a low pitch, then a high pitch. This cycles a few times with a period of several seconds until the tone eventually settles down to the usual 800Hz pitch and the raspy tone goes away. At this point the sidetone sounds pretty much normal. The behavior seems to me to be a control loop trying to lock.

I have not tried transmitting while all this is going on.

The amount of time that the pitch varies back and forth (up and down) seems to be related to how long the rig has been off. And the problem seems to be getting worse.

I have no idea what is going on in SSB mode(s) since I rarely use phone.

Am I correct in assuming that what I am seeing is some sort of problem with the CAR board/DDS chips?

My rig is s/n 30200393. I opened it up and find that the CAR board DDS chips are 6631's with a datecode of 9101. These are the sort that are eventually going to fail, correct?

I have ordered a new CAR board from East Coast Transistor, but they tell me that the board is on backorder until late May.

Any ideas?

Thank you and vy 73;

John N7ZN

4577. TS690SAT Intermittent Receive?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-13 08:27:35 UTC
From: Gavin Stirling
Topic: 4577 Message: 4577

Hi Folks, I have a Kenwood TS690SAT. It appears to have an intermittent receive problem.

On switching the set on it receives signals perfectly. After an indeterminate period of time everything goes quiet. You still get white noise and signals but they're down a good say 7 or 8 s-points, white noise and signals still audible but not at the same level.

If you wiggle the pl259 connector it jumps back up to normal strength. So you'd think it was the pl259. However having changed the pl259's, changed antennas and changed everything you still get the same result, i.e. it comes back for an indeterminate amount of time and then goes quiet. Thinking it may have been an so239 problem I resoldered the connection there too but that still didn't cure the problem.

Anyone else suffered the same problem with a TS450 or TS690 and how did you fix it?

Regards,
Gav

Dirty relay?? The receive line is switched through a relay so it
bypasses the antenna tuner.

Garvin

I had that problem and the wire from the so239
connector to the board had a cold solder joint. Been
several years but I don't remember it being to
difficult to fix. Good luck.

Max,
An invaluable tool with electronics, not just tiny surface mount stuff, is a lighted magnifier on a swing arm. You can often find them at surplus stores or junk piles for next to nothing. I got mine for $5. You could also mount a large magnifynig glass on an arm lamp which can also be had for just about nothing. Get the kind that uses a "C-clamp" and you can attach it to just about anything.

Glad you got your rig working again.

The other thing to try out is to connect the mike directly to the rig and bypass the wiring in the base. I tried that when chasing down RF feedback in the mike. Sure enough, the base was the culprit and after installing a few capacitors and inductors, I got rid of the RF feedback.

Roy,

I wear a pair of those 4.00x magnifying glasses from the local dollar store. You don't want to wear them too long but they're great for up close work. I put it back together but the monitor is still not working. The MONS pad is showing the proper voltages when the switch is engaged but I don't know what to check from there. Funning thing I have had the same thing hapen on 3 of the 850's I've owned. I can't remember if I put a jumper in under the board and I don't want to pull the IF board to find out!

Max

Hi

I have heard of cases where the antenna connector onthe TS 450/690 can come loose on the inside. You have to resolder the connection on the antenna jack. When you wiggle it, it cuts inand out. 73

What is the normal SSB pep power out for a TS-850? Mine says
about 135w on the built in meter and that was verified at the store
where I bought it today by two other meters. A third meter at my
shack also says about 130w +/- 5w.

Also, is my sidetone broken? I tried everything including adjusting
the sidetone pot - nothing. I guess it's time to build a keyer? Been
looking for an excuse to do that... hehehehe

BTW my last rig was a K2 which I tested with an Elecraft XG2. The
K2 scored -141.7dbm in the mds category. I just hooked up the
XG2 to my 850 and a -107dbm signal from the XG2 was S2-3 on
the 850! It's not just a bigger s meter reading - I switched back
and forth between rigs and the 850 flat out hears better - and not
by a little bit, folks. Makes me wonder 'bout the K2 but then again
I've got a wall papered with hundreds of QSL cards from it.

I'll miss my K2 - but not soooo much, knowing how much hotter the
850 is on receive....

I found out what was up with the CW sidetone:

http://n6tr.jzap.com/sidetone.html

I wondered if someone had done this mod on my radio so
I checked the MONI control - sure enough, all the way
DOWN! Turned it up & was rewarded with a nice sidetone.

D'oh!!!

Gav,

I have two (2) TS-690s and have seen this problem with both. It is in my option that there is a design flaw from Kenwood. There is a solid piece of wire that runs from the chasse mounted SO-238 to the filter board. On one of my TS-690s, the wire developed a cold solder joint at the SO-238. On the other, it was at the filter board. When the radio is moved around the weight of the feed line pulls on the SO-238. With this wire being solid, there is not much room for give and a lot of stress is placed on both ends where it is soldered. Once I found my problems, I replaced the solid wire with a piece of stranded. This way there is a little bit more play and I have not noticed any problems with these rigs since. Two things to note. I had to completely remove the filter board to remove/replace the wire. This was a little bit time consuming, but I think well worth it. Another thing. Take a close look at the diodes and resistors close to the output, as they may have been damaged if the radio was transmitted without an antenna. i.e. when you were not able to receive because of the broken joint, you would also not be transmitting into a stable load.

Just my two cents worth.

YMMV

Hi

I have heard of cases where the antenna connector onthe TS 450/690 can come loose on the inside. You have to resolder the connection on the antenna jack. When you wiggle it, it cuts inand out. 73

There is an internal pot to set max output level. If it were me,
I'd dial that puppy down. I'll bet the output isn't as clean as the
radio is capable of and it isn't "free power." The previous owner
of a friend's 850 had moved it up to 125w key down. It did not look
pretty on a spectrum analyzer. It was very nice at 100 w.

The design and production target of 100w out is there for good
reason... I'm sure Kenwood wouldnt have minded aadvertising 125+w
output if they could have done so...

Love my 850 too -- and i have had a lot of different ones in last 40
years. Good luck with yours!

Thanks for the input, Doug! After reading the manual (duuuh), I learned how to properly set the carrier/pwr/mic controls for a happy agc reading. I'm now only getting just above 105w and the on air reports are better.

Interesting stuff - when I built a fully loaded K2, I figured I knew a bit about radios.... Getting a new radio is always fun, esp. one that works this good!

I'll resist the urge to post a review on eHam for a few days just to make sure I don't miss a performance/feature/bug in my report. So far, I'm of the opinion that I've got a winner here.

BTW - Is there a way to tell if I have the TXCO without tearing the radio apart? The manual says some 850's came with the TXCO installed. I left the rig off all night then this morning came into the shack, fired the 850 up and immediately did a zero beat on wwv (switching from ssb to am and back). The radio was dead on freq with ZERO warm up time.

Heck - even a K2 is 80-150 hz off freq when you fire it up cold....

Well, I looked pretty carefully at both the CAR and the PLL boards. (Is this the 'mod' board', I find no board in the service manual called the 'mod' board?)

I see what might be a -small- disturbance to the solder mask near the 47uF/16V electrolytic on the CAR board. The other caps look fine. On the PLL board, I see nothing amiss.

Guess I will have to throw a scope on the output of IC3 and confirm that something is wrong. (This is one of those time I really wish I had a spectrum analyzer....)

BTW, I DO plan to replace these caps before I button up the rig, the recent anecdotes of leaking caps are something I do take seriously. And I would like to thank the list members who have taken the trouble to make us aware of the issue.

Thanks and best regards

John N7ZN

Quick and easy test for a leaking SM electrolytic cap.

Put your soldering iron on either connection as if you were going to resolder it. Your nose will tell you if it has leaked real fast. Ever smell burning cat piss??

John:
they are the 16 volt silver caps. on the car board and the service eng who told me about this at kenwood last year called it the mod board but i think in is the pll board. one of the guys did not see any leakage until he got a high powered glass and then he saw that they were just starting to leak. Kenwood said replace them period.

good luck

?????

I think you have 2 separate issues with the radio. Your audio output
has nothing to do with the RF output.

Make sure your CARRIER and output levels are both maxmum clockwise.

Check your coax connectors.

What is the audio doing through the headphone jack?

Check the carrier unit. Most likely one of the DDS chips is going out.
That's the same one that causes problems in the 850, YM6631.

Greetings to all

This will be my first posting since my approval
yesterday. I sold my Yaesu FT-897D and picked up a clean and like new
Kenwood TS-850SAT. With the FT-897D, everytime I wanted to change
something it was go to through the dozens of menus. Now dont get me
wrong, the FT-897D performed well, but was a pain in the butt to
operate. This TS-850SAT is my second HF rig. Can someone give me
any pointers. I am currently setting it up to play for the first time.

Good morning, Jim - congrats on your purchase of a fine rig! I too am a new
owner of a TS-850SAT and I have owned 2 FT-857D's in the past. Here
are a few pointers I've picked up since Thursday:

1: Set your CAR (carrier control) to about 3 to 3.5 when autotuning - too
low
a carrier and the tuner will just sit there, chewing. Too high and you
are polluting
the band.
2: Try LF! Tune from 200-450 khz in CW mode using the M.CH/VFO.CH knob.
The TS-850SAT has an excellent LF receiver! There are many CW beacons
down there. Kinda fun to hunt 'em down...
3: Check to see if your sidetone level can be adjusted from the front panel
with
the MONI knob - it's a common mod and a nice touch.

I'll post more as I, too, learn.

Ken KG0WX

Subject: [TS-850_450_690] Serial Number Question

My serial number is 21100507. Is there anyway to determine the year
of manufacture?

Thanks

Jim - ke4iza

first digit (in your case 2) subtract 2 - makes it "0" is the year ie. 1990
second and third digit is the month of manufacture - ie 11 is november

dont ask me why Kenwood adds a factor of "2" to the year of manufacture,
that just how they do it.

have fun with your 850, its one of the best used radios out there, and better
than a lot of currently new rigs

I purchased a TS-850SAT yesterday from AES Cleveland. They assured me that they DO NOT sell modified equipment. Before I call them and raise hell can someone please tell me what this radio is suppose to transmit on from 10m~160m? On 20m I can transmit on 14.499.99 and I know this is not legal. I fear I have bought a modified rig.

Is it they do not sell it, or they do not modify themself, or they dont knowingly....If you have all the mods, concider yourself lucky not have to pay extra for it.... you can always resolder the diode..

Hi Jim,

Sounds like it has been MARS enabled, which is legal for MARS operators.

Unless it is not functioning properly, I'm not sure this is something to
raise hell about...

If you want to operate on 60 meters you would need this mod done so
it is not just a CAP mod now.

This is NOT the point. I ask the saleman up front if the radio was
modifed and was told they do not accept modified equipment in trade.
I expected a radio as the factory made it, I paid for the radio with
this expectation and a factory radio is what I want. I guess I am
going to have a big fight with AES over this. They did tell me I had
a 10 day try out period. It IS GOING BACK for a refund of my $$$.
Maybe you think me nuts but I NEVER modify my equipment in anyway, EVER.

Hi Jim

Would be a good way to get on 60 meters. I have been thinking of doing the mod on my TS-450SAT so I can get on 60 meters. Wish it would have been done before I bought it, save me some hassle. 73

Jim,

If that is how you feel I suggest you return the radio. As another member said, you have save yourself some money if you ever intend to operate on 60m.

That being said, I consider this topic closed and any further messages relating to it will be deleted.

Well, to determine if it was modified you'd have to open it up to see if the appropriate diode was clipped, unsoldered or removed.

When I modified mine, I just lifted one end of the diode so I could simply solder it back when I want to sell it (if that day ever comes, which is unlikely!) :-)

Jim,

To ease your mind a bit, I bought my TS-850SAT new and it will also transmit on 14.49999. It will, however, drop out at 14.50000. Mine has no modifications at all.

the appropriate diode was clipped, unsoldered or removed.

When I modified mine, I just lifted one end of the diode so I could simply
solder it back when I want to sell it (if that day ever comes, which is
unlikely!) :-)

Maybe I am making a mistake by returning this. I have already had several outright offers to buy the rig if I did not want it. Was the TS-850 that good. It seems to be a really hot item.

Hello Cliff,

I tried, D31 seems to be good. But there are several D's that behave a little strange. For eg. D30 shows 240/240 on both sides. I read in the group that some diodes are designed by kenwood that way that they should act like the thing mentioned above. Now I'm confused.
Another thing I found out about my problem: The power decreases if I go higher than 20.999.99 MHz. At 20.999.99 MHz it has 90W on 21.000.00 it decreases to 40Watts. May be thta helps to solve the probelm?

regards,
Chris

Jim

Yes, it really is that good. I have one here that I have kept
since new, and would love to have a second one. I have
newer, more expensive DSP radios here, but I prefer to
use the 850 - I have the FT-1000 MKV field, TS-2000,
IC-746 PRO......but the 850 would be the last one that
I would sell, if I ever had to sell any equipment here.

I agree John,

I have had many of the newer DSP rigs across my desk too, and always come back to the 850. With the mods done, it is a super rig. Many features you can't find on the newer rigs today.

4629. TX frequency error (TS-690)

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-17 12:50:47 UTC
From: oz1cjx
Topic: 4629 Message: 4629

Hello group
I have been trying to repair a TS-690SAT for a friend.
The receiver works fine but the transmitter is off frequency in a
quite strange way.
From 0 to 75 kHz (At the dial) from the bottom of each 500 kHz segment
the TX frequency is around .073-74 kHz and when the dial exceeds .075
the TX frequency jumps to about .698 kHz above the segment start. I
can measure the sudden change in frequency at the output of DDS IC1 on
the CARrier board. (About L3-L4)
The reason might be a broken connection (Missing bit) between IC1 and
the DAC chips CP1 and CP2, but I imagine that this would affect the RX
frequency also?

Any experience/suggestions?

TIA es 73
Lars / OZ1CJX

I have to second John's opinion! I've owned a TS130S, FT-ONE,
Triton IV, FT-101B, E, EE, ZD, FT-107M, IC706MKII, TS2000X,
FT-817 (with the BHI dsp), 2x FT857D's and lastly, Elecraft K2 #4913.

Of the above list, the FT-ONE is missed the most. I sold the K2
last week to finance the purchase of my FT-850SAT. If you came
and offered me a FT-ONE AND my fully loaded K2 back in
exchange for my 850, I'd probably think for a few seconds then say
"no thanks".

Am I nuts? No, I realize that the above deal is a great one but it
has 1 flaw - it means giving up my TS-850SAT! Sure, I could sell
the other radios but from what I've seen, replacing the 850 would
be a real bear. I've made that mistake once (FT-ONE).

Yep, the TS-850SAT is that good. Wanna see how good? Wait
for a contest weekend then tune in a pileup on 40m cw. Now go
500 (yes 500) hz below the madness and play with the slope tune
function. That'll convince you.

There's a guy on eBay selling a 850 with dsp for $1,200 right now
and I think the only reason he has no bids is that 1) the radio is
heavily modified for HiFi SSB and 2) people are waiting till the
auction is close to ending so they can snipe the bid.

IMHO if you sell or return your 850, you'll regret it. 'nuff said?

Ken KG0WX

Topic: 1009 Message: 4631

Jim, I just checked the transmit frequency ranges of my unmodified
TS-850, s/n 30600519. They are as follows:

160M 1.70501- 1.99999 MHz
80M 3.00000- 3.99999
40M 6.50000- 7.49999
30M 10.00000-10.49999
20M 13.50000-14.49999
17M 18.00000-18.99999
15M 20.50000-21.49999
12M 24.00000-24.99999
10M 27.50000-30.00000

In contrast, my backup rig, which HAS been modified (by a previous owner),
is an Icom IC-726. It will transmit on ANY frequency from1.60000 to
33.00000 MHz as well as 50.00000 - 54.00000 MHz.

My unmodified TS850 s/n 2*******? transmitted only within the UK (region 1) bandplans..
I recently took the plunge and snipped one leg of the diode as I wanted the extra
100khz of 7mhz (7.100 - 7.200) that we were given here in the UK.
I did not want the rig to have wide tx but had no option.

I thought this was in the group files, but I guess not.

On the TS-850, you actually need to move a diode. To do the mod, take off D11 on the digital board behind the front panel and put it in the position of D9 (which should be blank if the mod has not been done).

I also did the mod on my TS-440 which involved just removing a diode. I had the TS-440 confused with the TS-850. The 850 uses surface-mount parts.

IF you are going to perk up the rig with mods, I'd recommend two others. One is to move the jumpers to bypass the AM broadcast band filters (why they put those in I don't know) and also do the noise blanker mod, which is in the group files.

The rig is already a superb performer but if you like to do some BCB DX'ing also, bypassing those filters really helps. The NB mod really perks up the blanker. And if you want to work 60 meters and have an oddball transverter that uses a strange IF like I do (26 MHz) the all-band transmit comes in handy.

I think most hams are responsible enough not to transmit out-of-band illegally after doing this mod.

Dern tootin', it's an excellent rig. The receiver rivals anything being made today. The audio quality is excellent. I use it in contests and it does well in a wall-to-wall strong signal environment. In fact, on Field Day it did quite well with all the other RF in the vicinity.

I did not have to move anything, just clip one diode. I asked Bill, K0ZL,
and he said the move is not necessary--and it wasn't.

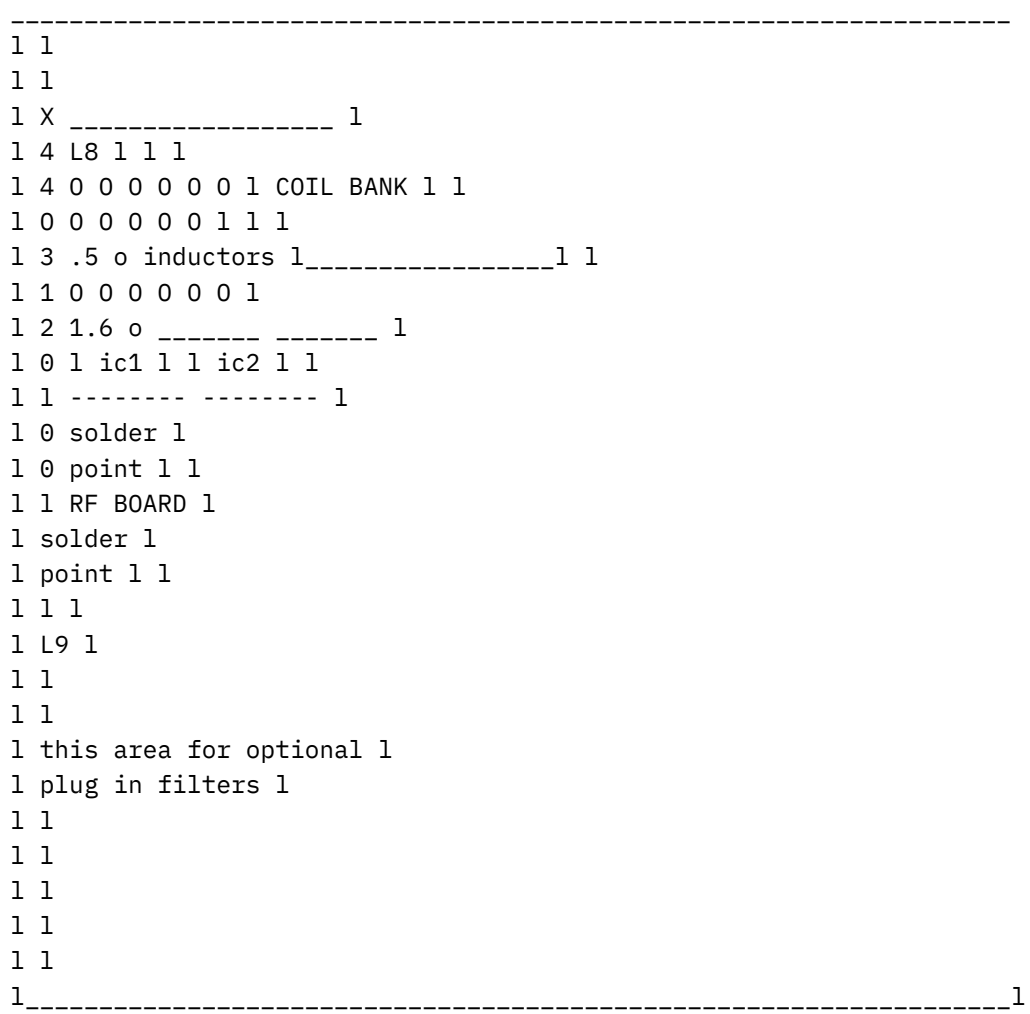
Topic: 1009 Message: 4637

1.. remove the eleven screws that secure the bottom cover to the rig. the six ones on the sides and the five on the bottom cover itself.
2.. remove the bottom cover. there are no wires attached to the cover. lift it right off. leave the top cover of the radio ON.
3.. locate the RF BOARD. it's number is: X44-3120-00. this is the board where you plug the optional filters into. with the open radio in front of you, and the front of the radio facing you, the RF BOARD is the one on the left. (there are only two boards under the bottom cover)
4.. locate the chrome like shield on the rear of the RF BOARD. it's made out of shiney steel. remove the four screws that hold this shield to the board.
5.. remove the shield by lifting the front of it up while sliding it forwards, towards you. watch out for all the little wires and ribbon cables going to and from the RF BOARD.
6.. look at the rear of the board and towards the left corner.(the radio is stil facing you upside down) notice two I/C's numbered IC1 and IC2. directly behind the I/C's are a bank of adjustable coils in metal cans. there are nine of these coils in a group. directly to the left of these coils are many green and red inductors which are standing up. they look like resistors but they're really small coils.
7.. these inductors are part of the bandpass filtering for each of the bands on the radio. the capacitors and resistors that complete the bandpass filtering are on the other side of the board and are of the surface mount type. you are only concerned with the bandpass filter for the .5 to 1.6 band. notice the numbers for the inductors. find L8 and L9. they are right at the edge of the board in the left rear corner you will notice that .5 - 1.6 is stamped right next to L9. BINGO! you have found the part of the circuit that you will modify.
8.. look at where the .5 - 1.6 is stamped on the board next to L9. you will see two bronze or gold solder points there directly next to the numbers .5 - 1.6 . there is nothing soldered at those two points. this is where you will solder a jumper wire between the bronze points. do NOT confuse it with the other two solder points with the line running in between them next to the phillips head screw!!! you want the two points that are spaced very close together that is right next to L9.
9.. you will have to do the soldering on the OTHER SIDE OF THE BOARD. remove the nine phillips head screws that hold the RF BOARD to the chasis.
10.. on the back of the radio, look for the switch stamped SW 1. it's right below the grounding post and has the two postions: INT and EXT. remove the two screws that hold the switch to the back of the rig. the switch is soldered to the RF BOARD and you wont be able to lift the board up until the screws are removed.
11.. unplug enough cables from the board so you'll have enough room to lift the RF BOARD up to solder the jumper. there is no need to remove the board from the rig. slide it towards the front of the rig until the switch SW 1 clears the back of the rig and lift the left side of the board up and prop it up with a small block of wood.
12.. locate the bronze solder points on the underside of the board. there will be a small amount of solder at these two points on the underside of the board.
13.. bend a small jumper out of wire that fits the two bronze points on top of the RF BOARD. you will place the jumper on the top and solder on the underside of the board. with a pair of needle nosed pliers, place the jumper into the holes and simply heat up the

existing solder on the underside until the jumper slips down farther into the holes. you'll notice the large amount of components on the underside versus the lack of components on the top of the board. be carefull when heating the solder on the two points. you don'y want to disturb the surface mounted parts or cause any excess solder to run onto them or the foil nearby.
14.. you are now done. re-assemble in reverse order, plugging the wires back in carefully, making sure they don't get plugged into the wrong place. also, avoid pinching them when replacing covers.



FRONT OF RADIO

Sorry, that's the best art work I can do. The purpose of the jumper is to bypass the two 150 ohm resistors that are in series after the bandpass filter. The resistors add between 20 and 25 db attenuation to the AM broadcast band. For some reason, Kenwood thinks that the receiver would become overloaded by strong nearby broadcasting stations, which would cause distortion. I simply don't find that to be the case. It's funny, Kenwood already had those two points there on the board, but without the jumper.....it seems to me that they had anticipated the need to bypass the attenuation in Europe or Asia. Thus, all export models going to the states were missing that jumper. Who knows? I can't find any other reason for the jumper points to be there.

Anyway, you'll notice an immediate increase of signal strength. You'll hear stations that you never knew were there! As I said, if you are bothered by strong stations in your area,

try using the 6 and/or 12db attenuation buttons on the front of the rig.

I beg to differ. You DO NOT have to remove the board. The jumper you need to install can be soldered directly to the holes on the top of the board. Make a short jumper and bend it into a "U" shape. Place one end on one of the solder holes and apply heat to the jumper just above the hole. The heat will melt the solder and the wire jumper will drop in place. Do the same for the other end, test your work and button er' up. I have done this on 4 850's and never had to remove the board on any of them.

Max

Thanks for the information! Question: I'm running a secondhand rig and the previous owner did several mods, like the mars/cap mod and the sidetone level control mod - does the TS-850SAT switch in it's BC Band filter at a specific frequency, low/high? I'm remembering other rigs where you'd hear a click and see a definitive drop in sensitivity when tuning down from 1800.000 kc.

What I'm trying to do is determine if this mod has been done before opening up the radio. It may be used but it has a 15 day satisfaction warranty, provided I don't get into the radio too much. Doing the mod would violate that so I'm trying to find out if it's already been done.

Does the 850 switch in the BC Band filter at a specific frequency so I can test if the mod has been done?

Ken,

I believe it kicks in at 1700 khz. If you are referring to the broadcast mod, this won't tell you. The bandpass filter will kick in (a.k.a. relay click) whether the attenuator mod has been done or not. You should be receiving local AM broadcast stations around 30 over 9 of the mod has been done, probably around S7 or so if not. To test for the general coverage mod, set the VFO on any frequency outside the amateur bands, i.e. 16.500.00 and hit the PTT. If the TX LED comes on, then the mod has been done.

Nothing difficult about it. Remove the 11 bottom case screws, remove the 4 brass screws that cover the bandpass filters, solder a jumper and you're done. It is not difficult at all. I did the balanced modulator feed mod yesterday and had the entire IF board out in minutes. Just pay attention to what you are doing and you have no troubles.

Max

Thanks for the help, Max - I hear no click at 1700kc but I'm also seeing VERY good performance! I wanted to find 2 clear spots - 1 on 160m AM and 1 in the broadcast band - so I could compare base noise levels with spectrogram. The problem was finding a clear spot in the BC band! I mean, I'm picking up locals S9+50 and DX out to 300 miles no sweat.

And that's at 2pm local!

What's more impressive is I'm not getting overload and the antenna I'm hearing this on is a ladder line 40m inverted V. I can tune 1480 for a strong
local music station then go up to 1500 and pick up a station in Waco, TX or to 1460 and pick up a political broadcast in Kansas City. FYI I'm in Wichita, KS.

I've never seen a BC band receiver with such performance! I love BC band DX'ing but had given up on the hobby years ago due to lack of good non analog equipment.

Looks like the 850 is much more than a keeper.... :-)

The DDS chips have 2 sections, one for Rx and the other for Tx. Either
can be bad and not affect the other. My bet is the DDS chip is bad.

It is NOT illegal for the radio to be able to transmit out of the ham bands.

It IS illegal for you to use it out of the ham bands without proper
authority, (Mars etc).

The TS-850 is NOT one of "the new rigs today".

It is old enough to vote, (and better than many of "the new rigs today!!). It is one of the top DX and contest radios of all time.

Sit back and learn to enjoy the great radio that you have bought.

4651. Problem with "retunr hf " caused by linear amplifier

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-18 13:18:43 UTC
From: Allan
Topic: 4651 Message: 4651

Hi all,

I had a problem with my linear amplifier and I beleive it caused a "return hf " in the ts-850sat.

Now at the maximum power of the transceiver (linear amplifier switch off) the modulation is bad, I have the 100 watts pep but no alc indication.

At 70 watts (linear amplifier switch off) all is ok, modulation and alc indication.

Any idea about this problem ? Is it a problem with the DC-DC board ?

Many thanks for your help.

Regards

Allan

4653. Do I need to open up my 850?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-18 22:49:30 UTC
From: Ken Bessler
Topic: 4653 Message: 4653

Today my rx started cutting out for an instant every 2 seconds
or so (random). I tried a different antennas, different bands, modes
etc. Tried tapping the desk, antenna switch then the rig. Nothing
made it better or worse. Suspecting a thermal issue or a cold
solder joint I shut down the radio for 20 minutes and it was gone
when I powered back up.....

I continued to operate, expecting the problem to return but it
did not. I even did a QSO simulation (I was in QSO on 10m
FM @ 25w when the problem started) into a dummy load.
Still, I could not get the problem to repeat itself.

Do I have a problem or like my local radio shop suggests, did
restarting the rig's firmware fix it?

Otherwise, the rig has performed wonderfully - last night I listened
to AM 1020 KDKA Pittsburgh, PA (I'm in KS!). Man - I really
hope this is not a problem as this rig is really a performer!

Ken,

Check your noise blanker switches. Turn both off and see if it does it. Also make sure the NB controls are both maximum CCW. If I turn on NB2 and turn the width control max, the receiver will cut out sporadically.

4656. BC band mod

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-19 02:14:34 UTC
From: john rogers
Topic: 4656 Message: 4656

I have also made the bc band mod on my 850. I listen to KMOX in St Louis from Springfield VA after sunset.

When I did my mod, I read the mod quoted that called for raising the board but studied the manual and repair manual and found I could just install the jumper on the plated through holes from the top. It works great and no overload problems.

I'll never let go of this radio. I'm an original owner since 1991. Saw it in Essex UK during evacuation from N Africa during Gulf I and had mine delivered to the hotel right after that in DC.

While I'm at it, the most unusual feature of the rig is the split band capability. I worked a long haul sked and many times the skip was not reciprical. One of the upper HF bands was good one way and another for the opposite direction. My dad and I each had 850s and would work split band to make the skeds. How many rigs do that?

73, John - W4BA, CN8GU

How low will we go? Check out Yahoo! Messenger□s low PC-to-Phone call rates.

Hi

I had the same problem with my '450SAT on TX a couple of weeks ago. I had no SSB or AM output. It worked fine on CW, FSK, and FM. It was like this for about a week. Even switched to 2 different mikes. I was about ready to send it in to get fixed, and for some reason, it just started working right again, and has been working for about a week now with no problems. Maybe something got reset or something.

Item # 9715226437

Just in case anyone wanted to get their 850 on 2m here's your chance. I have used this exact transverter on my 850 and it worked beautifully. Everyone on the local repeater commented on the audio. I foolishly sold mine but have a TenTec now. I have no affiliation with the seller, just thought if anyone wanted to get on 2m FM or SSB with their 850, this unit will do the trick.

4671. ts450s rx dropping

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-23 00:50:09 UTC
From: jason
Topic: 4671 Message: 4671

Hi all

I have a ts450s which is slightly dropping its rx , i would be monitoring on 40mtrs and you can hear the rx slightly drop noise and sigs drop about 2 s points then it goes back to normal.
It goes up and down , sometimes the rx is good for some time then sometimes every few minutes it drops up and down, i first thought it was someone tuningup near the freq and descening the rx'er but found that it was affecting other bands , also checked the antenna by putting the antenna into my ts850s and there was no drop in the rx but still the 450 was doing it on another antenna.
Had the radio looked at a few weeks back and there were 2 caps replaced that dropped the voltage on the tx/rx board causeing the radio to drop tx and rx.
Would be interested if anyone elae has had this prob with the rx dropping in sensativity on rx.

cheers from Jason zl2ft.

Hi Jason

This has been brought up before here on the list. The problem might be that the coax connector on the back is loose on the inside. Try and wiggle the connector and see if that doesn't make the signal come and go. Someone posted that there is a stiff wire that goes from the coax connector on the inside to the board and it can break loose and be intermittent. 73 and GL

4673. TS-850SAT Autotuner question

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-23 13:10:58 UTC
From: Ken Bessler
Topic: 4673 Message: 4673

Is there a way to adjust the autotuner's SWR threshold? Mine
keeps trying to find a match until it gets a 1.3:1 SWR or better.

I'd like to adjust that threshold to 1.8:1 or so.

4674. BCB jumper and DDS board caps in the TS-850

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-23 23:16:53 UTC
From: John
Topic: 4674 Message: 4674

I received a request to photograph the above-board jumper for bypassing the BCB (.5-1.6 mHz) attenuator. I also was feeling uneasy after the discussion of oozing caps in the transceiver.

BCB jumper - I have two pictures under an album named W4BA showing my bypass. When I did this I remember seeing the two pads the jumper is on then studying the manual. This jumper provides a series bypass of the "T" attenuater resistors while paralleling two of the 100 ohm resistors. This effective 50 ohms is now in series with the other 50 ohms of the "T" before being bypassed for RF and feeding the switching bias to the band filter. The other bands have 120 ohm feed resisters. There is no choke though thus putting the 100 ohm load on the filter. No doubt this provides some attenuation by loading but the trade off is a simple mod that I swear Kenwood must have planned on.

DDS board - Well my fears were justified. I just about missed the leakage of the caps. I started with the bottom of the unit and the attenuator look-see and moved to the top. All the dark blue caps. are fine with no leakage. Come the DDS board. The caps are the bright silver ones. I remember the red TAG cap I put in for C1 years ago. It literally exploded one day! Well the others are leaking. I have two photos in the same album as above. The first is with the dark spots aroung the caps. The second is after I had cleaned the goo off with a freon based solder flux solvent applied with a Q-tip swab. I need to get those 10 caps changed soon. The copper etching is not sever yet but it is very disturbing.

Hope this helps those restling with these problems. BTW, my S/N is 20900214 from 1991. I would love to hear other experiences.

73, John

Topic: 4674 Message: 4675

John,

Thanks for uploading the pictures. I did my BCB mod the same way, as I said in an earlier post, there is no need to remove the board as others have stated. I checked my CAR uit and only C1 had leaked. I replaced it with an electrolytic at 35V rating. All the others were fine. My unit is not much newer than yours, it's in the 21 mil serial range. I will be keeping an eye on it.

Topic: 4674 Message: 4676

Max,

Thanks for you comments. First, I called the board the DDS board. Really the Carrier board. I bring this up to avoid confusion.

It sounds like there is good interest in the BCB mod. from the off-line comments I received. This is a great receiver for that service. Glad to echo your tips on the jumper.

It was a good exercise going in again. I took a photo of each board. When I can't trust my memory next time, I will have the photos to call up! I made some of mine through the magnifying glass. It helped both me and the camera. Hi! I sure can't match Coors Bill's photo quality though.

4678. DC-DC Convertor

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-24 12:33:31 UTC
From: Duncan Cameron
Topic: 4678 Message: 4678

What is the current thinking on fixing the problem with the DC-DC board? Replace the two resistors, replace Q3, both?
Any suggestions on sources to replace Q3?
Thanks very much!

Thanks for your answer, this explains why the error in on the RX side
only, I thought that it was the same DDS circuit.
I have also learnt that the 6631 DDS chip has a reputation of bad
reliability, so it looks like I need one or two. (Or preferably the
newer 66312)

Any ideas as of where to find them? Or maybe a whole CARrier board?

Dave,
thanks for this info... I'm a previous Mouser customer.. :)
So you replaced the 10uf caps with the 22uf ?

Topic: 4684 Message: 4687

Hi Clint -

Yes, I used 22uf instead of 10uf. At the time, Mouser was out of the 10uf caps and wasn't going to have them until May or so.

If you look at the schematic, all these caps are on the +volage supply to the chips. They are used to help ensure clean, spike-free power to the chips, not part of a tuned circuit where the value is critical. They function like the big filter caps you have in power supplies, but are located right next to the ICs.

I used a higher voltage rating than the original, but that may also be overkill. The originals are 16v, and that certainly should be OK with the 5v in use.

I also tried to find the highest temperature rating in the hope they will last longer.

So in this application you can go higher with the capacitor value and voltage rating than the originals. There probably isn't any real benefit for doing so, but if that's what's available, they should work fine.

73,
- Dave

From: Steve Gehring
Topic: 4683 Message: 4689

Rich,

I☐m using a 599zx with my 850 with great results; the source audio comes from the ext speaker jack with the front panel volume set to the 9 o'clock position. The two-watt audio amp contained within 599zx drives a JBL Pro III bookshelf speaker well and without distortion for my ear's higher levels (slight hearing loss at age 40). Presently, I do not use the PTT line with the 599zx. But, do use it for keying the Alpha 374A amp ☐ if we☐re talking about the same ground offering PTT line.

What is the intended purpose for your PTT line? Is it to be used for muting?

Personally, I find the 599zx most excellent for CW or digital work, and just so-so with voice. The auto-notch feature does work well on voice modes, though.

Regards,
Steve, NL7W

4691. Ts-850 : ALC strange problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-26 07:20:36 UTC
From: Allan
Topic: 4691 Message: 4691

Hi all,

I have a strange problem with my modulation (ts-850sat+mc60), I did some test :

With 50 watts, compressor at 5 o'clock (10 db) , mic gain at 3 o'clock (alc indication is ok) so my modulation is good.
With 100 watts, compressor at 5 o'clock (10 db) , mic gain at 3-6 or maximum o'clock (alc indication fall down) , modulation very strong in the monitoring but on the airs the modulation is bad .

If I use the tuner, and tune the antenna, with 50 or 100 watts the modulation works fine.

But the swr not matched is good, i have 1.2/1.

Do you have any idea of the problem ?
Which board must I test ?

This problem start when I used my amplifier, maybe any relation ...

I search on internet but don't find something concerning my problem, find dc-dc board problem but don't look like the same symptomes.

A big thanks for any help,

Regards

Allan

Steve
It is for muting the audio. It is hard to hear what your
sending with the DSP Filter on CW thats my only problem I have with
it. It is an Excellent Filter otherwise, especially on CW it is
outstanding. It's just hard to hear sending CW especially when there
is a pileup or alot of stations on one frequency.

4693. RE: [TS-850_450_690] Re: Timewave DSP 599zx and TS-850S PTT Help??

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-04-27 01:44:57 UTC
From: Steve Gehring
Topic: 4683 Message: 4693

Hi again, Rich.

Unfortunately, the 599zx doesn't mute its audio in the CW mode (only voice audio is muted when the PTT ground is connected from the 850S). This statement is made on page 2-9 of the 599zx's Operating Manual, dated March 6th, 1997. If you'd like to mute voice audio, you could used what I've used for amp keying, which are pins 2 and 4 of the 7-pin DIN plug, labeled REMOTE on the back of the rig. I'm not sure how much current the 599zx sinks, so you may want to measure this to be sure it doesn't tax your rig's PTT line - or use the amp relay to be sure it doesn't.

Since the 599zx doesn't use the PTT line in the CW mode, and does get its sidetone from directly from the rig, I suggest turning up (or down) the rig's sidetone level. This is explained on page 65 of the TS-850S Instruction Manual.

Good luck and 73.

Subject: [TS-850_450_690] TS850 interface to TL922

Everything that everyone has said is true.

The TS-850S relay was design to key the Kenwood TL-922. No problem with the relay handling it.

BUT, when I hooked up my TS-850S/AT to my Drake L-7 Amp it all worked ok except that I could see on the wattmeter the "Hot-Switching", that is, I would get a RF spike out before the amp keyed and I would get a high SWR for just an instance.

Also I did not like hearing the noise of the relay in the TS-850S.

So the answer was use the +12 volts on transmit from the assc. socket. Key a transistor that then keys the amp. Many circuits have been designed for this so I don't take credit but the one I used sure worked.

I guess my TS-850S has been keying the amp for almost 13 years now. No noise relay.

The circuit I used and how to build it is on my website. The cost of the $4.00 box exceeded the cost of all the other parts.

Anyway a picture is worth a 1K words so give at look at:

http://www.qsl.net/k0bx/amp.html

Happy Keying.

Joe K0BX

There are 3 IF stages in the TS-850S - a 73 MHZ, an 8.83 MHZ and a 455 KHZ. Each stage has a filter, the 73 MHz IF has a wide 15 Khz filter that allows a wide band of signals to be heard at once. Of course the 73 Mhz IF does not have a switchable filter, but the 2 suceeeding IF stages narrow down the bandpass to a tigher 2.4 or selectable 1.8 or 500 HZ for cw. The advantage of the additional filters is the increased ability to reject strong signal interference that are closer to your recieve frequency. This becomes extremely apparent in CW contest or when the bands are very busy. Ultimately receivers have not really improved that much since the 60's and 70's! It has only been in the last few years that radios have started putting filters in the first IF stage commonly called a roofing filter that really improves the close in strong signal rejection. Sherwood Engineerring has a website that lists many of todays radios and has run receiver tests to see which ones are really the best. The ARRL has recently adopted additional tests to include receiver dynamic range testing at 2 Khz spacing.

On Sherwood's website the TS-850S that was tested was one of my own that I sent him. Rob Sherwood has some good reading on his website that covers the use of multiple filters as well as roofing filters to improve close in strong signal rejection. International Radio - INRAD has nice filters also. Hope this helps!

So basically, does it matter if I tighten up the 2nd IF and leave the 3rd IF loose or go the other way around and leave the 2nd IF at 6kc and put the 3rd at 2.7?

I'm guessing that opening up the 2nd IF would make the filter in the 3rd IF have to work harder so it might be best to cut in a tighter filter in the earlier IF?

Sorry - took a dumb pill today.....

There are two sets of filters because a single set cannot achieve as good performance as the combination of both, and also because having two sets allows the designers to add some functionality that is not possible with only one filter set.

From the point of view of shape factor and out-of-band rejection, filters at the lower IF (455 kHz) will achieve better results (both per dollar spent and in absolute terms) than is possible at the higher IF. If you have 500 Hz filters at both 455 kHz and 8.83 MHz, you can easily hear (or with sound card software, see) the difference in how well they reject signals outside the filter bandpass.

On the other hand, to get the best dynamic range (good performance on weak signals on a busy band with other stronger signals on nearby frequencies), you need to eliminate the unwanted signals as early as possible in your receiver's signal chain so that they don't overload it and swamp out the weaker signals. For this purpose you need filters at the higher IF.

So, you need the 8.83 MHz filter to remove strong signals up and down the band, but there will still be some filter blow-by and noise, which you can reduce more effectively by adding the 455 kHz filter.

If your main problems are AGC pumping, blocking or IMD caused by very strong signals a little way up or down the band, the 8.83 MHz filter is the one that will be most effective against these problems. If what you want to do is reduce QRM from close-in signals of equal strength to the one you want, the 455 kHz filter will be the one that does the most good for you. Use them both simultaneously and you will get better performance than from either one alone.

Having filters at both IFs is also what makes the 850's Slope Tune control possible. Each of the two knobs controls the centre frequency of one of the filters. One can be tuned upwards from its normal position, while the other can be tuned downwards. By using these controls you can achieve a narrower bandpass with the two filters than is possible with either one alone. However, while you can achieve a 250 Hz nominal bandpass this way from two 500 Hz filters, the performance is not as good as you would get from a single 250 Hz filter. Still, it's better than not having the capability at all.

73,
Rich VE3IAY

If you have them both, use them both. They work better as a pair. The only reason to leave one wider than the other is if you actually want to hear signals outside your bandpass in order to know what else is going on on the band. For that purpose, you would switch in the 8.83 MHz filter and leave the 455 kHz filter wider. I can't think of a good reason to set the 8.83 MHz wider than the 455 kHz if both are available at the same bandpass.

If you are contemplating buying a narrow filter and can't afford both, there are pros and cons to both choices; the 8.83 MHz filter will do more for the radio's dynamic range, but the 455 kHz filter will do better at removing nearby QRM, so the choice depends on what you want to achieve. The combination works better than either one alond, so if you can afford both, there is little reason not to use them together.

The 850's Slope Tune function requires the two bandwidths to be the same - if you try to use it with different bandwidth filters, you will probably find the results disappointing.

Hi

I usually set mine to go with the QRM. When contesting on CW, I screw all filters down as narrow as I can get them. For general operation I just play with them to see what sounds best. Sometimes the bandpass needs to be really narrow and sometimes just a little bit narrow. It is really nice to have the option to set them how you want them. 73

4705. TS-850 filter dumb question (not)

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-01 00:06:06 UTC
From: john rogers
Topic: 4705 Message: 4705

If your question is what filters to put in...load it up in the mode(s) you desire in both IFs.

If the question is how to operate...that is the beauty of the 850. You can select all the filters in any combination. 15 years going, I'm not sure what combination I will select for a given situation. I agree with the previous comment that in a contest I "screw down the filters as tight as I can". For a casual cw contact I may use the ssb filters and narrow up with the slope controls. I like the sound that way.

I have 500s in each IF for cw and the 2.?s in each for SSB. For swl activity I use the 6s and the 15 kHz.

John,

Are you referring to the stock 2.7 Khz filter? I thought the 850 only has provisions to add 3 filters?

Hi everyone!

This group looks like a great bunch of people and I appreciate its existance.

I have a TS-450SAT and it has terrible BCI problems from a local 1kw station on 1450khz about 2.5 miles away. I also have other rigs in the shack (TS-430s/Icom IC-725) and these rigs aren't bothered by the BC station at all.

The TS-450SAT is almost unusable on some bands because of this. I can clear it up alot if I use an external antenna tuner, as the external tuner then acts as a bandpass filter and attenuates the BCI. The TS-450SAT seems to be MUCH more susceptable to BCI than my other rigs. It is properly grounded etc., and I have spoken with the engineer at the BC station and he was very helpful and checked their equipment for spectral purity etc. and found no problems.

So my question is this: Is this a documented problem with this rig and is there a fix besides using an external tuner?

Perhaps a mod which allows the TS-450SAT to use its internal tuner on both tx AND rx? - I've seen such a mod for the TS-440SAT but not the '450.

The TS-450SAT seems to be a well designed rig except for this...

Any help and/or thoughts are much appreciated....

- Darrell/KA7BTV

Hi Darrell

I have 2 TS-450SAT's here in the shack and have never had a problem with broadcast interferance, even though I can see 2 towers from my house. What you might do is switch antennas from one of your other rigs and see if that makes any difference. Sometimes a bad connection can act as a rectifier and cause all sorts of problems. 73

Hi Darrell, how do you have your AIP set. If I remember correctly
you want the button push in.

4710. RE: [TS-850_450_690] TS-450s Broadcast interference

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-02 04:11:47 UTC
From: Steve Gehring
Topic: 4707 Message: 4710

Hi Darrell,

I☐ll suggest a high-pass filter that rejects the broadcast band. Take a look at the following W3NQN filters at www.arraysolutions.com:

http://www.arraysolutions.com/Products/BCB%20RF%20Filters.htm

You could place this filter between the rig and the antenna systems or network you have. It seems to offer around 50 dB of attenuation at the offending station☐s frequency of 1.45 MHz.

Good Luck and 73.

De Steve, NL7W

Hi Darrell

I have 2 TS-450SAT's here in the shack and have never had a problem with
broadcast interference, even though I can see 2 towers from my house. What
you might do is switch antennas from one of your other rigs and see if that
makes any difference. Sometimes a bad connection can act as a rectifier and

cause all sorts of problems. 73

hi all, can someone please help me, I have been using my ts850 to day ok but all of a sudden it gave out UL in cw and the frequency display is just a row of dots, if I move the vfo or change bands the frequency shows ok then goes back to a row of dots and the UL is again heard in cw.
cheers dave M0BZK

Dave,

"UL" indicates the phase locked loop has lost its "lock". I twould try reseating all the connections on the PLL board and digital board. If that doesn't solve the problem, some voltage measurements on the PLL board are in order.

I don't actually know much about the circuit of the TS-450s but probably it's worth a try changing the band switching diodes to real pin diodes. If they are the same as in the TS-850 it should be RLS135 diodes which can be replaced by 64Bar diodes. May be that helps suppressing the unwanted signals from the radio station.

Regards,

Chris, DM4DX

Darrell,

I don't think the 430 has a preamplifier in it and maybe the 725 also. Unfortunately, both Yaesu and Kenwood put the preamplifier ON as the default setup. Icom calls the preamp function just that, "preamp".

Turn the preamp off by engaging the AIP function. Yaesu calls disengaging the preamp "APO". That may help. I leave the AIP on (preamp off) on all my Kenwood rigs as well as my Icom rigs. Unless you really need the preamp (mostly at higher frequencies), you should have it off. I actually turn on the Attenuators whenever possible. It makes for easier listening and better QRM/QRN fighting when signals are already good.

Hope that helps.

Wow - what a difference! I turned AIP on for all vfo's and
memories below 10 mhz. I noticed hardly any loss of signal
but the QRN definitely dropped down.

Thanks for the tip, Roy!

4719. TS-850 Deaf

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-03 10:57:10 UTC
From: leezl2al
Topic: 4719 Message: 4719

I have just acquired a TS-850S S/N 31000 + and it is deaf! Really bad on the lower frequencies and progressively deaf as I go higher. Comparison with my FT1000D on the same signals and same antenna showed -6db on 1.5 mhz, -8 on 3.8, -15db on 7.0, - 20 db on 14.0 mhz, -30db on 18 mhz and well you get the idea! After consulting the archives, I replaced IC-1, the input diode selector chip and one other diode that looked suspicious. I did the mod that puts a 2.5mh choke from ant to ground to lower the input Z so it is not prone to lighting strikes. The exercise improved the situation by about 50% but it is still progressively more deaf as you go higher in freq so that 15M up is virtually dead. Yes ... I checked the RXB and it is 0.0V on RX as it should be and the same with the TXB. One interesting clue is that if I listen to an S9 signal on lets say 3.8 mhz and hit the 6db attn button it will drop one S unit or 6db as it should. If I hit the 12db attn button the signal drops to S 0 as it shouldn't do. It should drop 2 S units or 12db. In fact depressing the 12db attn button will wipe out most signals on any band. Anyone encounter this problem and any suggestions? _ Thanks Lee ZL2AL

The 12 db attentuator problem is probably unrelated to the other failure.

Does the AIP selection make any difference (improvement?). That's always a good test as it uses a different active preamp to see if that is a problem. It might be worth checking each of the bandpass signals to make sure one isn't sitting at ground for some reason. There are some that are driven by transistors instead of the 74LS145 that need to be checked too.

In my previous post I said my TS-850 is really bad on the lower frequencies. Incorrect and my error. It should have read that it is really bad on the higher frequencies. I put radio on a local BC station on 3930 and the carrier read S9+10db on the bargraph meter. I hit the AIP switch and it sropped to S6. With AIP OFF the 6db attn works OK and drops it 6db. The 12db Attn drops it to S1. With the AIP ON the 6db ATTN works OK and drops it from S6 to S5 and the 12db attn drops it to S0 and unreadable. Any thoughts Tree?

Thanks everyone for all of the good replys. I did try the "AIP" setting with no effect. I've also considered an external filter such as those mentioned but it shouldn't be necessary, and I'd have to rig a way to switch it in and out because I do listen alot on the AM broadcast band.

I also tried different radios on the same antenna (fullsize G5RV) and none of the other radios have this problem.

I noticed that the attenuator doesn't seem to work right - i.e. when you turn it on, ALL signals dissappear completely - even strong ones. I think that someone has attempted to or has modified this radio and mabye screwed something up in the process. It came from an estate and I think that I am the second owner. Anyway, if I find the problem and/or a good solution then I'll share with the group. Thanks again!

Topic: 4724 Message: 4724

Hi everyone, I'm searching for a DSP-100. If anyone has one they would like to part with, please let me know.

Thanks

Brian, VA3DXV

4725. TS-850SAT NB2 question

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-07 16:09:14 UTC
From: Ken Bessler
Topic: 4725 Message: 4725

Every now and then, my receiver cuts out for an instant, kinda
like the AGC is pumping from a nearby CW signal. It comes
and goes and has only happened on 1 day before today. Before,
I turned the 850 off and back on and the problem went away.

Not this time. I did notice that the problem happens on all modes
but not below about 5-6mhz. There the rig is fine.

To make a long story short, I found if I turned down NB2's
width or turned NB2 off it went away. I've also noticed a lack
of apparent effect from NB2 so I'm wondering if the rig cutting
out is actually NB2 cutting in and doing it's job sporadically?

Can any of you tell me how well your NB2's work? What should
I expect for performance if it is working ok?

Ken

NB2 was designed to blank the pulses sent out by the old USSR over the horizon HF radar. This was an obnoxious, loud, woodpecker sound. NB2 has the width control because the received pulse width could vary from time to time as propagation varied - multipath could cause the pulse to widen out.

Now that the USSR is defunct as a military power and Russia is not worried about ICBM attacks from the US, NB2 will probably never need to be turned on. NB1 is the standard pulse noise blanker and that should be all that you need. If there are some situations where NB2 helps more than NB2, that's great - but I would not expect it.

Thanks for the quick answer and explanation, Gary.

Russian woodpecker, hmmm? I'm getting AWACS radar on some bands/modes/antennas. Kinda goes tick, tick, tick like WWV.

....lemme try it......nope - no help.

For those of you who have not heard the "Woodpecker" before you may like to
listen to this:

http://www.cheniere.org/audio/Woodpecker.wav

For years in my SWL days the S meter on 14Mhz used to sit @40 over 9 making
the Band unusable.
Off Topic for the list but hope it may be of interest to the members..

Ken,

AWACS airborne radars are WAY different from those
used for HF Over the Horizon (OTH) radars, like the
woodpecker.

I'd expect a couple hundred pulses per second from
an AWACS radar, not a couple pulses per second or less.

I don't actually have any facts here -- just opinions.
How did you come to the conclusion that you were hearing
an AWACS radar?

I recently purchased a pre-owned TS-850S, SN 30900284. The unit performed very well until this past weekend when the entire display went black. I shut the unit off, then back on and the display came back for a few minutes, then faded out entirely. The display hasn't come back since the last 'fade out'.

All other fuctions of the radio seem to be normal. I can change frequencies, filters, modes, bands and and volume.

I do not have a shop manual for the radio and there's no hint of what to do in the user manaul. Please give me some ideas on where and what I should look for when I open it up.

Thank you in advance for any suggestions you can offer.

73,
Warren, NW4C

I live in Wichita, home to Boeing, Learjet, Raytheon, Cessna and
many other smaller companies. I live very close to Boeing and it's
neighbor, McConnell AFB. We see lot's of jets coming into here
for upgrades/testing, etc. I circled the base, testing for the signal
and it's defiantly coming from either the base or the shops at Boeing.

Several of the hams here that work at Boeing/McConnell identified
the interference when they heard it.

Tilt the front of the radio down (after removing covers of course).
Remove the display unit. In the middle of the backside of the board
is a large electrolytic cap (C18 IIRC). Replace it and repair the
damaged traces AND thru holes the acid damaged. Don't forget the thru
holes. Also one leg of the cap has it's connection under it. Trace it
out and jumper because the hole under it is usually no good.

Is anyone using their 850 with a SL-1+ unit? I just got on PSK31 this weekend on another rig
and think I'll enjoy it greatly. Was contemplating dedicating the 850 to PSK operation.
Looking at the manual and Tigertronics web site, I'm confused on how to set it up. Do folks use the Mic or the ACC 2 port? How do you have the jumpers configured in the SL-1+?

Thanks, Gary W7TEA

Do you think I have this problem about to happen in my TS-850SAT?
When I first turn my 850 on, depending on the temperature, if it's
warm the display comes on fine, if cooler the display takes a little
longer to come up, but stays on and works fine. I s this normal?

Velly Interesting, Ken...

I lived in Wichita (actually Eastborough) during my
high school years. After sitting down to dinner, we'd wait until a
B-47 or B-52 went overhead, and then said "Grace" right away before
the next one came over.

Wasn't a ham then, and there weren't AWACS then either.

Your fellow hams may be right, but I suspect something else.
Boeing my have EMP testing facilities, or something else,
but I sure don't know from my experience, and they do from
theirs.

Regards, Dan AA3LS

4748. Re: TS-850S Display goes black

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-10 03:01:21 UTC
From: Clif
Topic: 4740 Message: 4748

I don't know but it won't hurt to look.

The earlier serial number radios when left off for an extended period
of time would take several seconds to come on. If turned on daily no
problem, if left off for a couple of weeks, it took some time. Kenwood
never acknowledged a problem but the later SN's didn't do it?????

Clif

Other than mods.dk, is there another source for a
manual for the TS450? A .pdf version would be fine.

Or, if you have such, contact me off the list.

Thanks,
Craig - N4CQR

4751. TS-850SAT loses receive

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-10 22:06:27 UTC
From: Dan Wright
Topic: 4740 Message: 4751

I just bought a used 850 from a fella and I have had it three days and it has developed a problem...or maybe it had the problem all along....?

When I either go into transmit, OR use the up/down buttons to change bands, the rig loses receive. There is no audio and no S-meter reading. If I turn the rig off and back on, the receive comes back...I have audio and S-meter.

I did a microprocessor reset and it did not solve the problem.

Any idears?

Thanks es

73 de Dan -- WAØJRD ..

4752. TS-850SAT loses receive UPDATE

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-10 23:20:07 UTC
From: Dan Wright
Topic: 4740 Message: 4752

UPDATE.....

It appears that it might be heat related and it also appears that
it might be related to the autotuner itself. Is there a "mod" for the
850, like there is for the 450 so that the tuner is in line in receive as
well as transmit? Or is that a standard feature of the 850?

Hi Dan,

I have never used his service but from everything I have read and heard Tim does great, quick , reasonably priced work. Here is his website http://www.tdcommunications.net/ . I suggest that you get in touch with him and depending on what you hear, maybe consider him for your TS-850. Read some reviews about him at http://www.eham.net/reviews/detail/3554 . Good luck and please let the group know how you make out.

4758. TS-450 Case Stains

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-11 17:54:50 UTC
From: Craig Still
Topic: 4740 Message: 4758

I recently acquired a TS-450Sat. Everything is fine
except appearance. On the top of the case there are
stains from what looked like impressions from the
rubber feet of other equipment which are for the most
part circular cigarette smoke stains.

I have tried to remove the mess with, Goo Gone, Crown
Spray Power, rubbing compound, SoftScrub, alcohol,
and lastly soaking the damn thing with pure household
ammonia. Nothing has had any effect.
The amazing thing is the front panel and inside are
extremely clean which leads me to think the stains are
from gas heat / cooking.

Anyone have any suggestions?

Thanks in advance,
Craig

Bill is THE MAN. I am not sure why he has faded into the background of his groups. He did a repair on my 850 about a year ago, and has dispensed tons of priceless info on the web. I, for one, sure miss his input! If he is still doing repairs, his email was coorsbill@... last time I communicated with him.
You can read reviews of his work here: www.eham.net/reviews/detail/3784

Bill, K0ZL worked on my 850 year and half ago. He did a string of mods and changed the battery. I was very pleased and thought he was very reasonable.

Here is his site:
http://www.amateur-repairs.com/

You might check his turn around time because I believe he's popular. He also gave me the name, which I've misplaced, of another ham specializing in Kenwood repairs.

You could also download yourself

http://www.radioamador.org/rel/arq/kenwood/kenwood_ts450s_690s_instr_man_sch_pdf.zip

They also have the service manual listed

http://www.radioamador.org/rel/arq/kenwood/kenwood_ts450s_690s_serv_man_sch_pdf.zip

not sure of there quality, hope you have high speed

Ed,

They both appear to be the same copy. Many of the
pages are slanted to one side or the other, poor
rendition etc. etc. I simply thought there was a
better copy available somewhere.

Hard to believe there is only one (poor) copy of this
manual.

I have a manual on pdf here, and I dont find the slant offensive, concidering most pdf are made by persons at home, and uploaded to sites like mods.dk and others, I am happy to at least have something to read and give me my answer....Anyway, several sites contain the manual. were they created by the same person, I dont know, but keep them coming, until a better one comes along. Is that possible????

also, where are all the manuals going that come with the radio....It like the old "batteries sold separately" idea

I have found that there is an option in Acrobat Reader to rotate the view and you can turn the manual around so that it is in the right direction instead of sideways. I rotated mine and printed out what I needed and it looked OK. 73

4777. TS-850 : list of parts to spare?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-16 11:54:23 UTC
From: ha7wac
Topic: 4777 Message: 4777

Hi all! I am the proud owner of a TS870 but always wanted a TS850, so I got a mint one 2 weeks ago.
Well I read a lot about this marvel of tech. I worry only about the fact after a while there won't be some important parts.
I know that some common components can be easily replaced as capas, resistors, diodes... but what about some boards like DC-DC (if it cannot be repaired) etc...

Wouldn't it be a good idea if a tech OM could make a list of the parts every 850 owner should buy to keep "alive" their 850 as long as possible before they decide not to produce 'em anymore? And this list would be put in the "files" part of this forum...

What's your opinion about this? (Sorry I'm not a tech, and I just want to enjoy, as anyone of us, a long time my 850).

Thanks for reading me,
vy73 and God Bless you all,
Chris

4778. Does anybody have a spare DC-DC converter board?

I'm in need of a X59-1100-00 DC-DC converter board for a TS-850 needed on Field Day. I have them on order at both East Coast Transistor and Pacific Parts - have been on order for months. Both sources say they're out of stock.

Does anybody have one they'd part with?

I'll be at Dayton, if that's a convenient place to make the transaction.

TIA,

IF board
RF board
Filter board
PA board
DC-DC board
CAR board
Digital board

...and the list goes on. We could be here listing parts all day Chris. Best thing to do it keep your eyes peeled on eBay and QTH.com for 850 parts. Fred, N8BX, had a few boards on eBay not too long ago. I have purcased from him a few times and the quality and shipping are first rate. Prices are very reasonable too. Of course the easiest thing would be to buy a second 850 for parts and keep it in the closet. At a fleamarket just this past weekend a guy was selling an 850 with PS52 supply for $700 CDN. That is a good price, the rig was mint.

Max, are ALL of those boards failure-prone? I have, for instance, NEVER heard of either a PA or a filter board failing. I think the list should be limited to those things that commonly fail. My list, off the top of my head:

* The antenna surge supressor and whatever supports it
* A slew of capacitors to replace the famous leaking ones
* DC-DC converter board - or more
* Replace the CAR board pre-emptively if it has old DDS chips on it
* Replace the backup battery, and put it in a coin cell holder, pre-emptively

Hey Dave,

Yeah I was just poking fun. I guess my point was just buy a second 850 and keep it on hand for parts. The CAR board and DC-DC board for sure, some caps. Come to think of it not much else goes wrong with tese rigs, they are just that good. My latest acquisition was a Timewave DSP-9+. I feed the audio out from the 850 to the unit and then run the filtered audio into my soundcard for digital modes. What a difference it makes on weak signals. Perfect copy now.

73,
Max

Hello Guys,
Thanks a lot for your answers!
So DC-DC and CAR board are most prone to go wrong.
As far as I know they still can be ordered at Kenwoodparts.
Could be a good idea to order them. Caps can be found elsewhere and surge protector will be allright if I always plug off the antenna cable.
So I dunno if it's worth buying a 2nd 850...

QUESTION: are TS450 DC-DC and CAR board same as on the 850? (got a mint 450 at home... :)

Hope to cross antennas someday on the air with you.
All the best,
vy73 de ha7wac ...-.-

I don't think the boards are the same as this board generates the carrier used for the TX monitor circuit, which the 450 doesn't have. I would also pick up a spare TRX board. It controls the TX/RX switching and solders on to the IF board. Only about $11 US at East Coast Transistor.

Max

4786. No memory in my TS-450 Battery OK

Hello to the group.

I recently acquired a TS-450 from an estate that will not hold the memories
(holds them fine when the radio is on).
The battery is OK. I'm wondering if anyone can give some information on this
problem.
The battery was not replaced on the board. Instead wires were soldered to
the board and a battery holder was put on the other end of the wires.

Thanks for any help you can give me.

Ed, WB3LKO

I just did the battery mod on an 850, when testing found the same thing. Memories wouln't hold. Checked the battery and noticed I had wired it backwards!! Revered the wiring and all is fine. I would have suggested the same thing.

Max,

I took the battery out of the holder and put it back in the other way to reverse the polarity...still no luck.

Thanks, Ed

Follow the voltage to where it goes through the board to the other side. It comes off the battery, through 1 or 2 devices, then through a hole in the board. Check to see that there is voltage through that hole. That's what was wrong with mine, same symptoms. Had to run a small jumper.

If that's like most battery holders reversing the battery won't reverse the polarity, it won't connect. Make sure you have 3.2v to the circuit board. Hook the negative of the VOM to the chassis, not the battery. That will show if it's a bad ground. If the battery is reversed it will read negative numbers.

Clif

If that's like most battery holders reversing the battery won't
reverse the polarity, it won't connect. Make sure you have 3.2v to the
circuit board. Hook the negative of the VOM to the chassis, not the
battery. That will show if it's a bad ground. If the battery is
reversed it will read negative numbers.

Clif

I did check it that way and got the voltage to the board...with the battery reversed I got
a negative reading.

Thanks, Ed

I know the seril port works com1 because I just tesed it with another
sorce. I am using a6 pin cross cord pluged into the side of the
radio. How do I know if I am using 4800 baun. I have tried it on
auto-detect also. Thanks for getting back to me.

Make sure you have selected 4800, 8 data bits, no parity, 1 stop bit.
If that doesn't work try 2 stop bits. Both my HRD and MixW require
different settings. If the IF232 is faulty, you can build a new one
based on the circuit in the files section. It cost me under $20 in new
parts.

also, make sure your serial cable is at least 7 wire(factory made??) as
opposed to home wired , not 3 wire..

so maybe try a different cable, and verify again that you are on the correct
port

Kenwood TS-450SAT

Re: No memory in my TS-450 Battery OK

Hi !

You could have a bad memory chip. Or the previous owner or someone has disable the memory write on your radio. It says in the Service Manual at page 42

(number) 6 Memory protect write inhibit

(Number) 7 Extended Function Menu 1

Item 21 Memory protect 2 (write inhibit) should be OFF

Check this item, this could be it.

While you're at it also check the other items that they are set to there default settings.

There are explanation how to go to this extended menu function in the Service Manual. This goes the same for other Kenwood radios too.

Let us know what happens then

Hello Denis, I followed your suggestion and checked the Extended Function menu and all items were set to the defaults. Item 21 was set to off. The problem is some where else...probably beyond my ability to find it.
Thanks so much for your reply.

Could be one of many issues. Have you tried another Kenwood mic? This would rule out the chance of a bad element in the hand mic. Highly unlikely but possible. The MC-43S is the standard issue mic with the 850.

Has the carrier point ever been adjusted in your radio? If not set right, you could sound very muddy or extremely tinny. I use a Behringer XM8500 mic straight into my 850 and ALWAYS run the processor and high boost. I set my processor for about 5 db of compression and get very good audio reports.

What filter bandwidth are you transmitting through?

Keep us informed please.

Alas, I have no other 13 pin mic. I must read up on the filtering as I
am new to this rig and not aware of filtering options that come into
play on transmit other than what the hi-boost and processor perform.

Mic is 8-pin. The filter width can be selected in transmit if enabled.

4819. TS850 and D10-4

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-23 13:14:08 UTC
From: ha7wac
Topic: 4819 Message: 4819

Hello All,
I have a TS450, TS870 and for couple weeks a TS850.

Until now I have used a D104 trouble free (no RF feedback, clean modulation...) on the first 2 rigs mentionned above.
When I tried to hook up the mike on the 850, no problem with the background, but whenever I start to talk into the mike (functions: boost off and proc off, mic level at 9 o'clock) the ALC does go full scale easily and same noise will occur as when we have rf feed back, whatever the PWR output, at 10W also. Original hand mike works OK, MC80 also works OK. Is the trouble on the D104 (bad wired?) or are the 850 circuits else ? Any idea what it can be?

Thanks a lot in advance for any help or any idea,

vy73 Chris

PS: Other subject, if some of you are interested, DDS board on my 850 has the newer chips (66312), and s/n is 403####

Of late, I have been experimenting with audio processing. Not on the air, but just at audio. The Kenwood stock microphone has severely restricted highs and lows, compared to everything else in my shack. Bear in mind that the TS-850 was initially aimed at hard-core contesters and DXers. That's why it has such a bulletproof front-end - those are the guys who need those front-ends. That's also why it has the great RF speech clipper and the "high boost" feature. The microphone, accordingly, has a characteristically restricted frequency response.

I have used a cheap Panasonic dynamic mic, intended for use with an old cassette recorder, on my TS-850, and received "Wow, GREAT audio!" reports with it. I bought the mic for $1.50 from an eBay seller.

Dave,

You're right, doesn't take much to make the rig sound good. I have used everything from Behringer rack gear with condensor mics to Heil's and now use a $39 Behringer dynamic mic with no processing other than what's in the radio. Even with 100 watts and a vertical I usually get through pileups on the first or second call. As you can see in my latest shack photo I have done away with all the external gear and still get great reports on the audio.

4832. Re: TS850 and D10-4

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-24 07:07:08 UTC
From: ha7wac
Topic: 4819 Message: 4832

Hello Max,
TNX fer ur answer!
Yes I turned back the mic gain at 8-9 o'clock and no processor, no hi boost. And the D104 preamp level is almost at its minimum...
Dunno what's going on. I have personnaly 2 ideas: some component is defective on the 850 and pb does not show on some mikes, or my D104 is not well wired (?). I'll check the D104.
What is sure is that the original hand mike works well and the MC80 also (which is known to be sensitive to RF feedback).
What is amazing is that I brought the TRX and mike to a friend who's got a laboratory gear and put it on a dummy and reported me the D104 is allright on the 850 (!!!).

Strange... there would be any feedback?
What I don't understand is the fact that I experience this even with 10W...

Anyway thank you for your thoughts,
All the best,
Chris ha7wac

4833. Low receive on 22 Mhz

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-24 11:02:43 UTC
From: max_ve3tmt
Topic: 4833 Message: 4833

Can anyone tell me what might cause the recieve to drop out on my 850 in the 22 mhz range? As soon as the BPF relay clicks at 21.500.00 there is a noticeable drop in sensitivity. As I tune up in frequency it gets worse until about 22.000 it is almost dead. Then it starts to pick up again and by 22.800 it is normal? If the VCO voltages are out could this be the problem? It is not unlocking anywhere.

Suggestions?

Max VE3TMT

Turn off the preamp in the mike. Put the radio on a dummy load and see
if it's actually RF feedback or too much gain.

From: kj7f
Topic: 4836 Message: 4836

Gang,

I have a TS850SAT and rarely use it on voice. I recently talked to a buddy and he reported that the audio was not very good. The lows were gone and the highs were gone too! I put in a audio generator and was able to very his comments. The audio rolls off sharply below about 700 Hz and above about 2500 Hz. 850s have a reputation for having good transmit audio quality. Before I do something drastic has anyone run into this before?

Terry W7AMI

4837. My beloved 850 has died.

Unit is not powering on. I have 13.5V going into the rig, power switch is fine and voltage is reaching the digital board. However when I plug in CN604 I lose the 13.5V as if something is loading it down. Also I am not getting the right voltage readings on the two 8V regulators. I am stumped.

If it can't be fixed I will sell it for best offer as a nice parts rig. Any suggestions where to start looking?

Max

Hi Cliff,
I will completely turn off the preamp and check this again in a dummy.
It may be something silly cause the background (PTT pushed without
speaking into the mike) seems cristal clear...
Thanks for your help,
Vy 73 Chris

Hello Max,
Hope sincerely you can "wake up" your 850. I am not a tech
unfortunately, but I don't want to believe such a marvel as the 850 can
die...
Everybody's nightmare here in this group is that their beloved Kenwood
gonna die once. We understand your pain.
Wish you all the best and hope it can be fixed.
Let us know about the fix if hopefully there is.
vy73 Chris

Just received this power supply and after it heats up some
it tends to be noisy, a vibration/buzzing type noise.
Anyone know if this is normal? IF not any ideas where I should look
to try and find the problem? I was going to open up the unit tonite
to take a look inside. I believe there is a fan inside this power
supply.?

Thanks for any replies,
73,
Clint

As a guess, I'll bet you have a shorted electrolytic capacitor somewhere.

Manufacturers are notorious for trying to get by with the cheapest parts they can. Putting in electrolytics with rated voltages just a couple volts beyond what the cap will actually see can shave off a couple pennies from the cost of the unit but shortens its life too. I've seen 6 volts put on a cap rated at 6.3 volts!

When I worked in an electronics repair shop this was one of the most common problems I saw. I generally replaced the failed cap with something rated at about twice its expected voltage.

I am getting supply voltage on both the input and output of the 8V
regulators, not the 8V. When I plug in the offending harness even the
supply voltage on the cold side of the power switch disappears. I
unplugged all the harnesses and connectors on the board and started
plugging them back in one by one and not even the display comes on.
Like the rig is totally dead. If anyone wants a complete parts rig I
will let it go for $450 plus shipping.

Max

I was the one attempting to put together the kit. Could not get a quantity price break that was enough to justify it.

FYI, I found that mouser had the best price on 10 & 47 uf 35vdc radials, though this may have changed already.

Anyone else on the list who would like to pick this up and run with it, let me know.

4846. Inrad "Tuning Upgrader"

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-25 19:40:34 UTC
From: Tracey Gardner
Topic: 4846 Message: 4846

First post on the group so be gentle with me guys. :-)

I've just acquired my first 850 and started having a tune round with it.
One thing that struck me straight away is the tuning rate, I don't like
it.
For a rig that tunes in 1Hz steps a 1kHz per rev tuning rate strikes me
as being too high.
Perhaps it's just me as I had to have the tuning encoder in my AR7030
swopped for one that tunes at half the normal rate.

Anyway back to the point.
I see that Inrad do a "Tuning Upgrader" for the 850 and other rigs.
I've done a search of the archives and files section and can't find any
mention of this device.

Has anybody used it, or even got any comments on it please?

73s Tracey G5VU

Hi Tracey,

Push the "FINE" button for a finer tuning rate.

Subject: [TS-850_450_690] My beloved 850 has died.

Unit is not powering on. I have 13.5V going into the rig, power switch is fine and voltage is reaching the digital board. However when I plug in CN604 I lose the 13.5V as if something is loading it down. Also I am not getting the right voltage readings on the two 8V regulators. I am stumped.

If it can't be fixed I will sell it for best offer as a nice parts rig. Any suggestions where to start looking?

Max

Just received this power supply and after it heats up some
it tends to be noisy, a vibration/buzzing type noise.
Anyone know if this is normal? IF not any ideas where I should look
to try and find the problem? I was going to open up the unit tonite
to take a look inside. I believe there is a fan inside this power
supply.?

Thanks for any replies,

Hi Zack

The "Fine" button only provides a tuning rate of 1kHz per rev which is not
low enough for me.

Hi Dave,
Thanks for your reply.

Maybe it's transformer noise I was hearing.
When I got home this afternoon I opened up the power supply, and all looks nice & clean inside, fan was not seized. I turned on the power supply without any load and it's been on for over 2 hours, and is quiet now. I move the position of the power supply in relation to the other equipment to see if that may help. This power supply has now ground or 3 prong plug so I'm trying to determine if maybe some rf from my radio or pc was getting into the power supply. All my other none Kenwood power supplies have a dedicated groud connection, and they have always been very quiet. Will followup my results.

4856. max's dead rig

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-26 00:07:10 UTC
From: john rogers
Topic: 4856 Message: 4856

Max,

If something in the rig is shorted, it should blow a fuse in the PS. Perhaps it has a over current fold back that doesn't blow fuses but not the usual. I would verify that the supply can deliver first. You can have an open circuit voltage at the supply that can deliver no current.

If that proves, pull the 12 volt lines to the boards and find which is loading it down. I have had C1 on, I think, the rf board short. My supply was stiff and the cap exploded with a bang!

The PA may be soldered to the 12 volts with no connector. It is in many rigs and if shorted will sit as a big short across the buss.

Just some preliminary thoughts. Divide and conquer.

Hi Rich, can you put together a list of parts that you were going to put in the kit. The item number or Kenwood part number, the value you would recommend using as a replacement and type, and on what board they go on. I know you said Mouser had the best prices on some of the items. I have always had good luck with Mouser and the fact they have no minimum order makes it nice for guys like us. If you have the Mouser numbers that would be great. I would like to order the parts so I have them on hand and can replace them when I have the time.
PS, Are there any other parts WE should be replacing other then the battery? It seems like I remember something about something on the display board.

Thanks, Al, n7ioh

The following advice is based on complete and total ignorance of the
TS-850 except what I've gleaned from this group (I have a couple of
TS-450SATs). If you can find room to deadbug a CMOS J-K flip-flop
(C4073??), you should be able to wire it up to divide the encoder
pulses by 2 or 4.

Regards,
Ed

Dave,

Thanks for the idea. I rarely us the processor so it was off when
I was talking to my friend. I did turn it on just to see what would
happen but it didn't help the audio quality any.

I ran a more sceintific test this afternoon. The -6dB audio
bandwidth should be 400 to 2200 Hz according to the TS850 manual. I
measured 700 to 2800 Hz. I have about the correct bandwidth but it
is shifted to high.

From: max_ve3tmt
Topic: 4860 Message: 4860

At the group advice I tried another power source. The radio powered up!!!!!!! However I think the battery is depelted as it doesn't put out full power and it cycles between TX & RX if I keep it on transmit too long. I am going to let the battery charge overnight and try it in the morning.

Thank you greatly for all the pointers. The old supply apparently was registering voltage but no current.

Max VE3TMT

Hi Max, if you have two fuses in your DC power cord, check them both. Sometimes the negative fuse will blow and you will still be getting negative voltage through the coax braid or a common ground. You may not be getting enough amps to work correctly, but enough for the radio to cause you fits.

They're both good Al. The battery charged up enough overnight to show full power output on the TX side this morning. Still not fully charged but at least I know the rig is okay. Thanks for all the advice guys, if I hadn't of tried it on another supply someone was going to get one heck of a deal.

Max

I assume that the "high boost" is turned off???

Dennis

kj7f <kj7f@...> wrote:
Dave,

Thanks for the idea. I rarely us the processor so it was off when
I was talking to my friend. I did turn it on just to see what would
happen but it didn't help the audio quality any.

I ran a more sceintific test this afternoon. The -6dB audio
bandwidth should be 400 to 2200 Hz according to the TS850 manual. I
measured 700 to 2800 Hz. I have about the correct bandwidth but it
is shifted to high.

I'm thinking about trading my TS-45SAT and a Icom R70
Rec for a TS-940 is there a yahoogroup for the TS940
so I can subscribe to.

Thanks Russell NC5O

Terry,

Sounds to me like your carrier adjustment is out. The adjustment
involves little pots on the sub board under the top hatch but you
have to access a special menu first.

http://www.w3oz.netfirms.com/newkenwood850setup1.htm

About halfway down the page you will see the setup for adjustment the
carrier set point. It starts with STEP 1, STEP 2 and so on.
Let us know how you make out.

Max

4869. FS: TS-850SAT W/DSP, MC-60A & PC cable

Yahoo group: TS-850_450_690 (2006 — 2009)

Topic: 4869 Message: 4869

I'm offering a gorgeous TS-850SAT, S/N 30500xxx plus
extras. I'd prefer to sell as a package deal. The package
comes from a non smoker's QTH and has been babied.

Condition of all equipment is 10 out of 10 both cosmetically
and electrically. See the following webpage for Spectrogram
images of receiver performance:

http://members.cox.net/kg0wx/

The TS-850SAT has several mods done - Mars/CAP,
Side tone monitor, BC Band sensitivity, TX power (the
rig puts out a clean 140w). There may be a xtal oven in
the rig - I'm too chicken to open her up to look for that
board but the rig is dead on freq with WWV as soon as
you turn it on.

Also included is a MFJ-784 "Brick Wall" DSP. It is one
of the best performing DSP's I've ever owned and IMHO
the term "Brick Wall" is VERY well deserved. The DSP
costs $250 new

Included with the package is a mint condition MC-60A
desk mic and a ZLP electronics computer interface. They
are worth $180 new.

Say $900 for the rig, $150 for the DSP and $125 for the
mic & PC cable = $1175.00

Asking $1175 or best offer for the package with free
Priority Mail shipping in the lower 48 states.

Payment by PayPal to

Subject: Re: [TS-850_450_690] Someone awhile back mentioned a 850S Capacitor Kit? Is it Ready?

Hi Rich, can you put together a list of parts that you were going to put in the kit. The item number or Kenwood part number, the value you would recommend using as a replacement and type, and on what board they go on. I know you said Mouser had the best prices on some of the items. I have always had good luck with Mouser and the fact they have no minimum order makes it nice for guys like us. If you have the Mouser numbers that would be great. I would like to order the parts so I have them on hand and can replace them when I have the time.
PS, Are there any other parts WE should be replacing other then the battery? It seems like I remember something about something on the display board.

Thanks, Al, n7ioh

4874. TS-850 Audio quality question

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-27 02:39:43 UTC
From: kc9enh
Topic: 4874 Message: 4874

I have poor audio quality in my transmit signal. No low frequency, brassy, mid to highs only. Thought it might be the handheld mic initially and then I hooked up my Heil Goldline with much the same results. I have only found the high boost (off is necessary) and processor to affect my monitored audio and my received reports. Neither of these improve the audio. I am asking if there are any other adjustments that adjust audio output. I am waiting on a desk mic that was used previously with this radio to see what it does for me. I had the radio opened to replace the dc-dc converter card. Also replaced the soldered in memory battery with a clip-in from a pc motherboard. Any suggestions or info on "hidden" menu settings appreciated. I find the manual for this rig somewhat lacking.

4875. FS - Price lowered a bunch - TS-850SAT

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-27 12:18:59 UTC
From: Ken Bessler
Topic: 4875 Message: 4875

I'm offering a gorgeous TS-850SAT, S/N 30500xxx plus
extras. The rig comes from a non smoker's QTH
and has been babied. I removed the DSP from the package
per requests and lowered the price $300.00.

Condition of all equipment is 10 out of 10 both
cosmetically and electrically. See the following
webpage for Spectrogram images of receiver
performance:

http://members.cox.net/kg0wx/

The TS-850SAT has several mods done - Mars/CAP,
Side tone monitor, BC Band sensitivity, TX power (the
rig puts out a clean 140w). There may be a xtal oven in
the rig - I'm too chicken to open her up to look for that
board but the rig is dead on freq with WWV as soon as
you turn it on.

Included with the rig is a mint condition MC-60A
desk mic and a ZLP electronics computer interface.
They are worth $180 new.

Lower price!!! I'm selling the DSP separate per requests.

Asking $875 (nope - not a typo!) or best offer for the radio,
mic & cable with free Priority Mail shipping in the lower 48 states.

Payment by PayPal to:

4876. Low IMD Power Above 100 Watts from a TS-850S?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-27 20:13:25 UTC
From: Steve Gehring
Topic: 4876 Message: 4876

I didn☐t know the TS-850 series generated low IMD power above 100 watts. Is this really possible, given their design? If so, what☐s the mod or re-alignment?

Please note, the two-tone IMD levels generated by a 100 watt level TS-850S are NOT stellar ☐ somewhere around -26 to -28 dB.

Thanks.

Steve, NL7W

Steve,

Thank you for pointing me in the right direction. I followed the alignment proceedure outlined on page 104 of the 850 Service Manual. That brought up the output 5 dB at 400 Hz. I'll see how my friend likes the audio next time we talk.

4878. TS850S Power Out Problem?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-28 03:04:15 UTC
From: sp600jx21
Topic: 4878 Message: 4878

I just received an '850S I purchased. Looks great, 3mil serial number. Checking the power output into a dummy load in CW mode, the power climbs just a bit, maybe 5-10 watts in 10 seconds, on each band. That doesn't seem normal to me. Aproximate output power on each band is as follows: 160m-55Watts, 75m-130w,
40m-130w, 30m-138w, 20m-100w, 17m-100w, 15m-47w, 12m-53w, 10m-40w, 10m(29mhz)-33w. Something tells me it has a problem, can someone confirm this? It was sold to me as excellent however I don't believe these power figures are indicative of a properly operating '850S. What is the cause of this power output problem? What is the cure?
Any info will be greatly appreciated.
Thanks,
John N0EE

4880. Packet Problem with TS 450 S

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-28 22:35:01 UTC
From: Roy
Topic: 4880 Message: 4880

Hello,

(This is my 1st post here, so please bear with me)

I have been trying for about a year now to get my TS 450 S to play in packet mode. It will RX with a Nomic rigblaster no trouble at all, but I cant get it in TX no matter what I try. I have followed RigBlasters instructions to the letter, with no joy.

I have also tried the ACC ports at the back using other TNC's and AGWPE, but that did'nt work at all.

I like data modes and my TS 450 a lot, and I dont want to part with a very good rig so any help will be greatfully RX.

Many thanks and My Best regards to all.

Roy

Roy,

Exactly what is it not doing? It is going into TX mode and no audio or just not TX'ing? There is a pot on the IF board that controls the data level going in through the ACCY port. Perhaps it is turned down. But since it is not working through the mic jack either I would assume it to be external. Are you hearing the packet tones on your TNC? Give us an idea of what you have and haven't tried.

Max

Mine does the exact same thing. On keydown it takes about 10 seconds
before it reaches full output, starting at 75 watts then rising to
about 100 after 10 seconds or so. I was never sure if it was a problem
or not, since everything else seems to work fine. My power output is
more even across the bands than yours, but it still shows lower output
on 160 and 10 than it does on the others.

I'm also curious what's causing it.

A properly operating TS850 will put out 100w on all bands. It will not
rise after a period of time.

The radio has a problem.

You need to measure the current draw on each band at max power out.
That will tell if there is an ALC problem or something else. 100w
output should draw between 16-20A depending on the band. The lower
bands will draw less and go up gradually as the freq is increased.

Clif

4886. Kenwood YG-455CN-1 250Hz CW filter Ringing?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-29 11:49:25 UTC
From: Tracey Gardner
Topic: 4886 Message: 4886

I'm thinking of transferring the Kenwood YG-455CN-1 250Hz CW filter that I have in my AR7030 receiver, into my newly acquired TS850.
However before I do so I'd like to know if other TS850 users of this filter find that it "rings" quite badly?

It seems to do so in my 7030, whereas the Inrad 125Hz filter that I also have in the 7030 is excellent and shows no sign of ringing.
I'm just wondering if the Kenwood filter could be suffering from a mismatch in my 7030 and might perform OK in the TS850?

Thanks to those who replied to my query regarding the Inrad "Tuning Upgrader".
Nobody who replied had used it, but I've decided to take the plunge and order one.

My 850 also goes to max power almost instantaneously. The readings on
my MFJ-872 meter vary enormously from band to band, but then again
that's MFJ.

Thanks to Dave & Max for their replies. Sorry I was not more specific.

Basicallu it wont TX in either SC or TNC mode

The ACC socket used with a TNC would never go into TX but would receive, so I sold on the TNC. I had an engineer check out the port and he had no response from fully open to fully closed on the data pot.

The Nomic works fine on PSK rx but will not put the radio into TX. All the jumpers are set corectly. The Interface works fine on TX & RX on another Kenwood set.

I am probably missing something quite simpe here, but please bear in mind I am NOT a technically mined person and a lot of this may go over my head! as per the instruction from WestMountain I have set the radio for max output on RF output and about 50% on Audio.

If you need any further info please advise.

Many thanks & Best regards

Roy

The TS850 uses switching diodes to switch the out/in lowpass filter. If they leak, both the output power and rx sensitivity suffer. Check mods at www.mods.dk

Topic: 4878 Message: 4890

I will try your suggestion on mine sometime soon... hopefully this evening. I'll post the results.

Here is another symptom, but in the AM mode this time.

If I key down for a few seconds, carrier will rise after several seconds just like CW... after letting it rise, I set my carrier control to 40 watts (but leave RF power at full), a quick whistle or "HELLO" will swing it to near 100, then the carrier will drop to 20 watts or so and then slowly climb back to the 40 and stabilize until I modulate again. Audio also sounds a bit "fuzzy" on AM over the air.

Hello Ed,

I've tried all configs, RTS, DTR, Vox, Harware the lot. It NOW appear's I may have a US Comm port connector or Socket. I just uninstalled the port and 2000never picked it up, so I did a manual install and still nothing is happening.....

roll on tonorrow, I can get outta here! (to quote our colonial cousins!)

Many thanks and Best regards

From: Steve Gehring
Topic: 4886 Message: 4896

Wow. I hope someone has experience with the 250 Hz filter in their 850S, and can answer you. If you decide to move it over, I☐m sure a few of us would like to hear your experiences on this forum.

Right now, I☐m running an Inrad 8.83 MHz I.F. 400 Hz filter in my 850S. To narrow the b/w down further, I use an outboard Timewave 599zx -- which isn☐t ideal, but works. At some point, I☐d like to try an additional 250 Hz filter in the 455 KHz I.F. I really believe this setup would be perfect for excellent performance on CW.

Best of luck,

Steve, NL7W

Subject: [TS-850_450_690] Kenwood YG-455CN-1 250Hz CW filter Ringing?

I'm thinking of transferring the Kenwood YG-455CN-1 250Hz CW filter that I
have in my AR7030 receiver, into my newly acquired TS850.
However before I do so I'd like to know if other TS850 users of this filter
find that it "rings" quite badly?

It seems to do so in my 7030, whereas the Inrad 125Hz filter that I also
have in the 7030 is excellent and shows no sign of ringing.
I'm just wondering if the Kenwood filter could be suffering from a mismatch
in my 7030 and might perform OK in the TS850?

Thanks to those who replied to my query regarding the Inrad "Tuning
Upgrader".
Nobody who replied had used it, but I've decided to take the plunge and
order one.

73s Tracey

Subject: [TS-850_450_690] Re:PAcket problem (copy2)

Thanks to Dave & Max for their replies. Sorry I was not more
specific.

Basicallu it wont TX in either SC or TNC mode

The ACC socket used with a TNC would never go into TX but would
receive, so I sold on the TNC. I had an engineer check out the port
and he had no response from fully open to fully closed on the data
pot.

The Nomic works fine on PSK rx but will not put the radio into TX.
All the jumpers are set corectly. The Interface works fine on TX &
RX on another Kenwood set.

I am probably missing something quite simpe here, but please bear in
mind I am NOT a technically mined person and a lot of this may go
over my head! as per the instruction from WestMountain I have set
the radio for max output on RF output and about 50% on Audio.

If you need any further info please advise.

Many thanks & Best regards

Roy

G0WNQ.

4899. TS850 audio "ticks"

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-31 07:28:43 UTC
From: ha7wac
Topic: 4899 Message: 4899

Hello Guys,
I have now my 850 for 3 weeks, and soon discovered something tiring while listening. I precise that this does not happen on the 870 nor 450 radios which I also have, same place, same PS, same evenings when tried to compare.

850 settings: QRG 14Mhz USB, AIP ON, AGC: slow (850's AGC is rough!), NB 1&2 OFF. Used antenna is 1/2 wave dipole outside over the roof. No grounding of antenna nor radios.

When listening to the radio (as yesterday evening), background noise was around S1-2 and I noticed that sometimes several times in a minute the S meter suddenly peaks to over S9 make some bassy "tick" and back to normal reception (as when somebody switches on a lamp and it can be heard on the speaker of an AM bradcast receiver).

Hope I was enough clear. Has anyone experienced this? Is there any faulty cap somewhere (on AGC board or somewhere else...)?

Thanks for reading me,
All the best,
Chris

4900. Capacitors a little off topic

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-31 16:56:15 UTC
From: n7ioh@cybertrails.com
Topic: 4900 Message: 4900

Hi all, my question is a little off topic but it is still a Kenwood radio. I have a R-5000 receiver and I need to replace the filter cap on the power supply board. The original cap is a 15000uF 25V cap. I would like some input as to what cap would be better to use for a replacement. I am looking at two that I have found that will fit in the space available and one I can make fit with a little work. The first is a 22000uF 25V cap and the second is a 15000uF 35V cap, both 85C temp rating. The last is a 22000uF 25V cap with a 105C temp rating. I don't know why the original cap failed, old age? My question is do I go for the higher 22000uF for better filtering or do I go for the higher voltage rating or the higher temp rating with more capacitance? I don't know if this cap is prone to failure or not. Would the 22000uF be too much and cause other problems? I would like some input from someone who knows about this kind of thing.

Thanks, Al, n7ioh

If you have voltage regulators after the 15000uf, it is better to stick to this value, as you may damage them. If your radio was working fine, no hum or other funny things, then I would stick to 15000 uf, perhaps with a higher voltage rating, and not with more ufs

4902. Re: TS850S Power Out Problem?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-05-31 21:23:49 UTC
From: Brian
Topic: 4878 Message: 4902

Full power on low end of 160 draws 15 amps, high end of 160 draws 17 amps. Low end of 10 meters draws 16 amps, high end draws 17 amps. The only standout was near the top of 40 meters where it was pulling 18 amps, same on 30m. On 20m it only draws 14 amps at full power.

This is according to the meter on my Astron RS-35M, which I assume should be reasonably accurate.

Any ideas? Any comments about my description of AM operation (below)?

I have never used mine on AM.
Do you have any control over the modulation level apart from the mic level ?

If you can hear it on an AM broadcast receiver then it's not the the
850. It's something external.

4907. Carrier Adjustment question

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-06-01 14:22:51 UTC
From: kc9enh
Topic: 4907 Message: 4907

I have been trying to improve the audio quality of my 850 and read the carrier adjustment article from a few posts previous. I held the F. Lock button while powering up the radio to access the Menu 00. The display flashed the entire time I was in this mode performing the calibration attempt per the procedure. I adjusted the pots on the carrier board as described while modulating a fairly constant tone, such as I can produce anyway. I did not really notice any great improvement in frequency response of the audio in the earphones. My question is this, should the display flashed during this procedure and since I did not notice any change in audio, did the procedure not actually work, or might I have some problem with the carrier card?
Thanks

I would not be using a tone for adjustment procedures. You should be speaking into the mic as you adjust the pots and if it you are doing it properly you will definately notice a difference in the tone of your voice. It will vary from tinny on one extreme to bassy on the other. You adjust one pot for LSB, one for USB and the third to balance the sound between the two sidebands. Pay attention to the filter settings as described in the instructions, as it determines what your signal sounds like. And yes the display should be flashing the whole time until you hit the CLR button.

An equalizer won't neccessarily help you if the carrier settings are
off. The tx audio bandwidth won't change with an EQ, you will merely be
emphasizing the frequencies that are there.

Lets say the normal TX bandwidth is 200-2600 hz approximately. If you
shift the carrier point, you may be transmitting at the same bandwidth
but in a range of say 500-2900 hz. In this case, an EQ will not help
you with frequencies below 500 or above 2900. You want to get the audio
range right before the EQ comes into play.

Clif,

He was not saying he heard it on an AM receiver.
He said it sounded like the sound you sometimes
hear on an AM receiver when a light is turned on
or off.

He wants to know if he's got a unique problem,
really, or is this something others have observed.

I've not had the experience you have, Chris.
Is there a possibility of a reasonably local
arcing source? Welder, Electric Fence, or some
power switch or relay nearby? Does this happen
often? Fairly frequently? Can you listen with
multiple recievers at the same time?

I hope you are able to narrow down the scope of
the problem, Chris.

I have had a similar problem. The TS850 has no mains input filter. The ferrites on the dc cable may not be enough. I have fitted a mains input filter (ferrite ring and capacitors) from an old TV reciever. It fits easily in the ps50 psu.

Paul,

That might be a reason I don't hear these (or haven't yet, anyway)
-- I use an ASTRON 35 amp linear power supply, and I suspect the
huge additional capacity (and capacitors) may filter my supply
more than if I had the PS-50 or another power supply.

Thanks for your suggestion.

Well, I know three things about him:

1) He's a subscriber to this group
2) He has an address book with this group's address in it
3) He inadvertently opened the same e-mail he received from somewhere
else, even if just by clicking on it.

This e-mail is insidiously set up to send itself to your address book
using your real e-mail address unbeknownst to you.

I'm reading my e-mail with a text-only access on my server and don't have
an address book, so I'm immune as far as I know. :-)

Doyle,

Measure the voltages on the TRX sub-board. Check pin 7 for 8V in both TX & RX. Check pin 10 for 8V in RX only. If it still bleeds off here try jumpering pin 7 to pin 10 while in RX mode. If the receive comes back then the TRX board is faulty. Had the same symptoms on mine only I lost TX. Traced it back to this back and saw a smoked 2SA1204 on the board. Replaced the board and all has been fine ever since.

Max

The TRX board in on the IF board. Turn the radio over and the IF board is on the right assuming the front of the 850 is facing you. The TRX board is in the upper right corner with a few others. It is labelled on the IF board. Pin 1 is on the left, pin 11 on the right.

OK, I went to measure the voltage on the board. Moved the board slightly to visual the components before turning radio on. When powered up everything was fine. I tapped on the board and still OK. As the old saying goes, "Leave working boards alone". It goes again I at least know where to look.
Thanks

Might be a cold solder joint. You should be able to touch them up from the component side if it happens again.

Morning Charles,

I have had one for years with nary a lick of trouble... It is the same as the TS-450 and I don't think as many were sold but it has the 6 meter band and is a little gem! I use it as a backup and SO2R radio with my TS-950SDX as the main radio... Side by side, the 950 has a bit better receiver but only slightly better and I would use the 690 without reservation. Works well on the occasional field day and camping trip also...

Hope that helps...

Date: 2006-06-18 17:36:18 UTC
From: Brian
Topic: 4878 Message: 4954

Anyone have any more insight into this problem? I suspected the DC-DC board, but I tested it while in the radio under operation and the output was -6.2 volts regardless of mode or power output. From what I've read, it's operating properly. Any ideas?

Hi all Kenwood lovers,

I just bought my third Kenwood rig (First the TS690, also the TS850) the TS-570DSG. I am looking for a Kenwood 500Hz CW filter, type "YK-88C-1".

An equivalent of Inrad is also OK, as long as it is 400-500Hz.

Who has one for sale for me?

Please your reply to: LetYourFingersTalk @ gmail . com

Thanks,

73, de Kees - pa7two - m5two.

Just FYI the YK88C and the YK88C-1 are NOT interchangeable. Besides the fact the C-1 is on a small PCB it also has a different center frequency. Therefore you cannot put a YK88C on the PCB and use it.

I have a copy of the service Manual in black and white
Very usefull except when you try to locate a component on a board
So I try to find a scan IN COLOR of the COMPONENT SIDE VIEW & PC BOARD VIEW
So Anyone can help me and scan IN COLOR (pdf or jpeg or bmp or whatever) the following page ONLY :

116-117-118-119-120
129-130-131-132
141-142-143-144-145-146
155-156-157
161-162
165-166
169-170
174-175-176-177-178
195
202
206-207

Thanks in advance for all the time you will take to do it and 73's

4966. Digital Display Calibration Cable

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-07-05 02:37:30 UTC
From: William
Topic: 4966 Message: 4966

Greetings
My TS-450-SAT is starting to be just a little off frequency. I read in the manual that the display could be adjusted using WWV as the frequency standard using an accessory calibration cable. Is this a "special" cable or can a plain old insulated jumper wire be used. Pacific Coast Parts doesn't even list the factory cable on their replacement parts list.

Thanks in advance
"73" from Lawrence County Indiana!

William, I believe the cable is a small diameter coax coable with the push-in ends similar to the others in the radio. Although not as accurate, you can adjust the rig by tuning to WWWV at 15 Mhz and while alternating between USB and LSB, adjust the oscillator trimmer cap for identical tones. Not as exact as the recommended method but if the rig is that far out you will see some improvement anyway.

Max

I am looking at a a TS-850S with a serial number in the 50 million range. Is there a source where I can fin out if the range came with the 66312 chips instead of the 6631? Thank you.

I have both rigs and would be happy to share comparisons off line. I have only used the VI+ for CW. I've used my 850S/AT for SSB, CW and some PSK-31. Both have InRad filters. Let me know your operating interests and I'll give you my 2 cents worth if I've any experience with
the rigs in those areas.

Yes, the 50 mil version had the good chips - they changed around 20 mil!

Hi Gary -
Thanks very much for the response. I operate 100% cw......but I will often listen to SSB - just prefer to transmit in cw only. THanks again.

Hi all

My TS-450SAT has developed a problem where the receive is way down. I have 2 of them and with one, a signal will be S-9+ and on the other it's about S5 or less. Most signals are not even moving the S-meter. Transmit seems OK. I wiggled the coax jack, thinking it may have come loose on the inside, but didn't seem to make any difference. It is like the attenuator is switched on, but it isn't. When I switch the anttenuator on, it goes down even more. Where should I start to look? Thanks and 73

I would try to inject a signal after the relay board. perhaps right into the tuner at first.
Contacts in those little yellow relays can go bad. Or just inject a signal right into the first receive rf amp. On the IF board if memory serves. If you need any help I can look ti up for you.

Allan,

There was a problem with some of the DDS chips on the CAR board in the
first few years of production - 1990 and 1991 or 10 mil and 20 mil serial numbers
the later 850's came with the 66312 chips already installed see this link!

http://n6tr.jzap.com/850repair.html

I have 2 850's a 40 mil and a 50 mil - both came with the new chips installed.
If you are not having problems I wouldn't worry about it - possible that you may
have the new ones or yours are doing ok as is!

All,
Wanted to advise that Chipquik works as advertised for easy
removal of surface mount devices! I used some where I used to work
in a soldering certification class...but this is the first time I've
used it "for real", and I am impressed. (no, I don't own stock)...
I have a TS-450S ser 30million and change...has the old DDS
chips (YM6631)...and had a transmit failure exactly as described
elswhere...ordered the
replacement chips from East Coast Parts. I am still in the process
of pulling the old chips...I ran out of Chipquik getting the first
IC off the board, as I was just using the "sample pack". I need to
buy some more before I tackle the second IC.
I did want to get the word out on how good the Chipquik works, in
case anybody else is tackling this kind of repair.
Proper thanks to Dave, K7NG, for his help on this project.
73,
Don

I'm the original owner of a TS 850s/AT purchased in June 91. The serial number is in the 20 mil series. I've never had a problem with it. Opened it up today and confirmed that it had the 6631 chips. C1 doesn't show signs of leaking yet either. Maybe not all early rigs are plagued with issues--I'm hoping. Bill K0ZL changed out the battery last year (and some other upgrades to DC-DC, NB and sidetone) and no leakage there yet either.

Mine is also in the 20 mil series and C1 was leaking. It also has the older style DDS chips. While doing all the mods for another hams 850, I cheecked it for leaking. Also in the 20 mil series but it showed no signs of leaking. I replaced C1 just in case.

As C1 is more prone to leakage I only replaced it. However it would be nice to find an entire DDS board with the new chips on it! On my particular board the leaky cap has eaten away the trace under it and right through the board to the other side. It is well worth checking your rig for leakage.

4996. TS480-SAT Output Power Drops

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-07-19 03:17:06 UTC
From: w4jz
Topic: 4996 Message: 4996

I posted this on the 480 group, but never got a response. I was wondering if some here might have a 480 & have seen this problem. It seems to only happen when rig is first turned on.

I have a TS-480SAT that when transmitting on FM or RTTY will drop full power out after about 5 minutes transmission when rig is first turned on. I checked menu 22, Time-out timer, & I have it set for 10 minutes. After rig has warmed up this problems seems to go away. This started last Saturday. Sunday it worked fine up until tonight. Power supply is an Astron 37 amp & 13.4 volts is being supplied to rig while transmitting. Fan comes on & I do not receive a TEMP-HI message on rig. This also happens while transmitting into a dummy load. Output drops to about 3 watts out. Any suggestions on this or what to do?

I also sent this to Kenwood. My warranty runs out the 20th of this month. Also where is best Kenwood warranty service center? Or is there a good Kenwood service center?

Thanks,
Reed W4JZ

Thanks Dave for the reply. Voltage on recieve is 13.8 & drops to 13.4 on transmit & remains constant. I know this rig has a lot of protection on it & I believe one of these might be causing it to cut off. Why I don't know. Today it never did cut off. I even left it keyed down into dummy load for over 10 minutes at 100 watts out. Power never dropped.

I'm waiting to see what Kenwood says, but believe if I send it in they want be able to find it unless it fails all the time.

Thanks,
Reed W4JZ

5000. TS-850S And AL-811H

This is for you list members who also have an AL-811H HF amp.

I finally found an AL-811H amp for my TS-850s. How do I tell if the 10 meter mod has been done on this amp without hooking it up? I'm in the process of making ready my shack for the new piece of equipmnet. Here is what I still need to do.

Run another 20A 110VAC line to the shack.

Make Ts-850S to AL-811H cables.

Revisit the station ground.

Get high-quality high-power low pass filter.

Test the amp.

Oh boy, this is going to be fun. This is my first HF amp.

How I know which year is particularly KENWOOD TS-850S made?

Is some models better then others (ts-850s), is something specially
should I be aware when buying used TS-850S?

Thank You
Samir, SM7VZX

Subtract 2 from the first number in the serial number and that is the
year of manufacture.

I believe the 30 mil series came with the new DDS chips.

Hi Mark, as far as good low pass filters the Bencher YA-1 seems to be one of the best made with very good specs. I had to go and dig mine out so I could be sure I gave you the correct info.

Al,

I have the Bencher low-pass filter you reference. I got it when I had my Kenwood TS-520S ten years ago. I'll have to dig it out of my inventory. My current rig, TS-850S, caused interference on 40m only through my satellite receiver.

I've mounted my antenna, R-7000 vertical, as far away from my and neghbor's houses as possible, at the rear of my large residential lot. I still obliterate the television. I've got a high-pass filter on the satallite receiver.

Hi Mark, I just did a quick search in the eham RFI forum with the search word "Satellite". Here is a link to the search results.
http://www.eham.net/forums/search
I think it would be better for you to go through them and see what best fits your situation. If you don't find anything there you can go to the RFI forum and see if someone there can come up with a good solution to your problem. I have had very good results just searching through the eham forums for information. Many times when I am bored I will just start reading the headings in the forum lists like Amplifiers or Emergency communications etc. I am always amassed at the information I can pick up from the forums. Good luck on solving the problem.

Has anyone been able to duplicate the colour pages on this Service Manual. I understand that it is no longer available from the publisher. The one I had borrowed became "unavailable" before I attempted to do any scanning or such duplication. I have an excellent manual from an online vendor but of course the colour pages are in black and white. I have my 850 running normally and am finding the past messages and links very useful. Keep up the good work folks, 73 Gordon.

I don't know where you are looking but D31 on the RF unit is an RLS135
and the recommended replacement is a MI204. It doesn't have anything
to do with the attenuator but if it shorts it kills the RX.

WOW..no room here. is that in pdf, or separate images, can it be zipped with HIGH compression. is it online somewhere now, I could see if I can make it smaller.

I had a pdf (large) for upload to mods.dk, and he redid it and dropped it to 3 meg original was 26 meg

There are 35 pages scanned. Some pages overlap because the pages fold out in the manual--like a Playboy centerfold :)

The total file size on my Mac is 30.9 MB. It only compresses to 28.5 MB as a .zip file. Would
be happy to upload it or send a CD to someone with adquate space on their web site if they were to host it for wider distribution.

The only compression utility I have here is an "archive" option built into OS X. It produces
a .zip file but doesn't compress it very much. Again 35 individual files averaging 1 MB each.
If anyone has the right software, I'd be happy to share.

Steve, if by torque you mean the drag or stiffness of the knob while you turn it, you hold the inner ring and turn the main knob. You can feel the indents as you adjust.

Other than the ring that is part of the tuning knob? I've always held the front part of the knob tight while rotating the back ring to chenge the torque.

OK, let's try this. Using your browser go to idisk.mac.com/gtuck-Public

I've uploaded the files to my public folder on .Mac. Never done this before so hope it works
for everyone. Click on the down arrow symbol on the far right side and pages should download. Tried it on my XP laptop and it worked fine. If it works for folks, I'll leave it up for
a week before deleting the folder from the .Mac server.

I don't know that these are all the color pages. They are just the ones that another ham requested and I scanned.

When I look at it with Netscape 7.2, I see "gtuck's public folder" with a line below it saying "TS-850 manual" with a little arrow to the left. Clicking on the arrow loads a whole page of document titles with a "down" arrow to the right of each. I click on the right arrows and it asks me if I'd like to download that document. I downloaded all of them.

Thank you very much, Gary! These pages, in color no less, have always been hard to come by as PDF files.

It worked for me - Win XP and IE 6. At first I only saw one line
with a right pointing arrow to the left of it. When I clicked on the
arrow, it changed to a down arrow and the 19 file names appeared
with a download button to the right of each one. The downloads went
fine. Thanks, Gary.

Topic: 5043 Message: 5049

Hmm ... dunno what to say. I just tried it with IE 6.0 and I get the same thing. The "TS-850 manual" with an arrow pointing to the file on the far left followed by a little "folder" icon to the right of it. I click on the ">" arrow and it then shows the whole page of files. Each has a "down" arrow on the far right. Clicking on each "down" arrow downloads that file.

I'm using XP Pro with IE 6.0, Netscape 7.2 and Enigma Browser and they all seem to work.

OK... tried again ... this time I just kept on clicking in the right empty column, then finally the folders all opened up, and I was able to download each file. Maybe if someone else is accessing the files you can't acces them until their done downloading.

5052. ACC-2 Menu Options?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-08-23 12:27:49 UTC
From: Frank
Topic: 5052 Message: 5052

Greetings all,

Is there possibly one of the menu options that controls the level
of the ACC-2 rear din audio input? When a friend of mine uses it,
he get all kinds of distortion, even in the mic output.
He says:
"I know a lot of people use the din to get their transmit audio from
the TNC's transmitted. I tried to run the audio from one of my old
RASCAL's into it and also tried to feed the audio from my TNC into
it for running AFSK. As soon as I have the device set up on mine,
the distortion is there."

Any help for my pal appreciated. TNX
73,
Frank/WD8NIK

Glad it seems to be working out. I first tried to upload one zip file of all the pages but it
seemed to choke so put them up individually instead. Still may try the single file but don't
want to interupt anyone's download.

I'm about ready to put my 850/AT on the market. Hate to but have to lighten the load,
and buy my daughter a new computer. Being an artist, musician and Mac devotee, it won't
be a $500 Dell-- :) If anyone is looking for one, send me an email.

If the input level is high enough to cause distortion, cutting the level down after the point where the distortion is introduced will do no good. You need to reduce the level before that point. In the case of the Rascal, that means first reducing the sound card output level (if it's at max, the distortion may be introduced inside the sound card), and if that is not enough, also adjusting the Rascal's level control to attenuate the signal some more before it gets to the radio.

One other suggestion would be not to try to connect two audio inputs in parallel. Try connecting only one at a time to see if that solves the problem.

The audio input to the ACC-2 connection has to be externally adjusted.
There is no internal adjustment. IIRC it wants about 100mv or less.
Speaker audio is way to high. Most likely the distortion is caused by
RF feedback.

Clif

I zipped the entire folder of 35 files and it only reduced the size by about 10% so figured it
wasn't worth it. Later I'll try to post the zipped folder again so folks only have to do one
download rather than 35.

I like the individual files better myself. If one file gets corrupted,
you're only missing one page.

5066. TS-850 Intermittent Audio "Problems"

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-08-31 16:32:42 UTC
From: Ron
Topic: 5066 Message: 5066

I have TS-850SAT powered with PS-52. I am having intermittent audio "problems". Loud buzzing, almost like feedback, gives me impression interference is being induced from close source. At first symptoms seemed to happen after radio warmed up, but last couple of nights, frequency and duration of the interference was intermittent. During the day, radio operates fine with no problems whatsoever.

I just moved out to the country and power quality is less than desireable. Have turned off everything in house in hopes of isolating the problem, but it still occurs, albeit only at night. It's probably quarter mile to nearest neighbor so skeptical that intensity of interference is caused by them however have not ruled that out. Before I approach them, was wondering if intermittent voltage drops due to poor power quality could cause this type of behavior.

Appreciate any other thoughts as well.

Thanks and 73

Ron - AG1P

FYI - I borrowed a computer UPS system and plugged the PS-52 into it. Problem went away. If I disconnected it from UPS and plugged direct into my surge protector, problem came back.

then sound like it should NOT be done through the surge ..it is probably trying to limit, because the power supply may be pulling more than its capacity, or sudden key ups are "surges" and it is trying to protect the powers supply.

5069. TS-850S/AT for sale

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-09-01 20:14:14 UTC
From: w7tea
Topic: 4334 Message: 5069

I now have four HF rigs in a small shack. Selling my 850 today and probably an Omni VI+ later. I am original owner of the 850s/AT, non smoker, purchased in June 1991. Serial number 20800237. Never have had a problem. Used for CW primarily and PSK31 of late.

Has three optional filters: 2.1 khz International Radio filter in 8.83 IF and 400 Hz CW filters
in 8.83 and 455 IFs. Bill, K0ZL, (www.amater-repairs.com) replaced the battery (no leakage),
did the NB and sidetone mods, DC-DC mod and aligned a year ago. He said if DDS chips had not failed since 91, they are not likely to do so now.

Original box, manual and service manual. Also SP-31 speaker, power cord and all the connectors I can find hi. Will throw in MC-85 and MC-50 free . Not used either mic in years.

One issue. There was a smudge on top of the front panel. I stupidly cleaned it with alcohol and rubbed the grey paint off--so now there is a black spot. Pics available on my public .mac
folder (idisk.mac.com/gtuck-Public) . Package for $700 plus shipping and insurance from 97230.

Please reply off the list to w7tea@...

To all,

I really appreciate your help with this!

This still only happens at night. Had radio on all day bouncing between 160 and 10 meters with no problems. I tried removing from surge protector and no change. Put 7 amp-hr gel cell in same position as PS-52, using same wires in same positions and problem goes away. So think I've narrowed it down to line power, not antenna. However would think the TVs and stereos would experience same problems and they do not. That being said, we have only been in the house 2 months and have replaced all the light bulbs at least once, some twice.

I drove down street a little earlier and there are some houses about half mile away that appear to be using mercury vapor lighting. Don't know enough about the lights to know if they can induce signal into power lines as well as RFI to the antenna.

While I figure out how to prove this to the power company, checked the ARRL web site for temporary solutions and they list some AC line filters. Would appreciate any recommendations as to best one(s) to buy. Or am I better off just buying larger gel cell, trickle charger and use them until I get power company to fix their problem? Am also open to any other ways to fix this.

Again, really appreaciate the group pitching in to help!!

Hi all,

Could someone tell me if it's possible to find a similar kenwood paint 's
covers ?
I have a 850 to restore and i'd like to repaint all covers.

Many thanks,

Regards

Allan

Silva, use your browser and go to idisk.mac.com/gtuck-Public

Open the TS 850 folder and all the color pages are shown. Click on the down arrow on the right hand side of each color page file and it will download.

Some auto paint stores can take a digital picture of the color of the rig
and match it very closely. Some can even put it in a spray can for you. 73

5078. Problems with display

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-09-03 16:23:39 UTC
From: George Philips
Topic: 5078 Message: 5078

Greetings to the group.

My name is George Philips, call VU2GT, location Mumbai, India. I have been licensed for 40 years now.

I own a TS 850 S AT. I have had this rig for more than 5 years but I have not been very regular on the air. Recently when I powered up the rig, I found that the display does not come on but all other functions seem normal. I do not have a service manual for the rig. I would appreciate any help from group members to set this problem right. I have the necessary tools to do repairs but am not competent to handle complex jobs.

Any tips would be greatly appreciated since we do not have any agency in this country whom I could approach for help.

Thank you,

George.

It's not a hrd fix if you don't mind digging into it.

Covers off, top screws on front removed so front panel tilts over.

Remove the screws holding the display PCB in place and tilt it over.
Only one plug to undo.

When it's out look on the side opposite the display connector and you
will find a large electrolytic cap, It has leaked and damaged the
traces/thru-holes. Repair the damage, especially the thru-holes under
the cap and all should be fine.

Clif

Let me know if you need more detailed instructions.

Kenwood TS-850 Service Manual - missing page

Sept 7, 2006

Hi Gary and the rest,

I have finally finished downloading via slow dial up all the 19 color
PDF files of the Service Manual. However I'm wondering what is the
contents of the following "missing" pages :

page 121 to 128
page 133 to 140
page 147 to 154
page 157 to the last page

I have donwloaded pages 1 to 115 from mods.dk

It would be great if someone here can provide a scanned copy of these
missing pages to complete the Service Manual.

Thanks in advance,

Dennis Ls. M. Cruz DV7-BKO

HI Frank

Is your squelch on? I had that problem here on my '450SAT, but mine was just that only real loud stations would come through. Someone mentioned the squelch, and was my face red. 73 Tom W7WHY

Good morning all. I have a TS-690SAT and for some reason there is no rx anywhere on the rig including my local am broadcast bands. I have already checked the antenna connections both inside and outside of this radio. TX appears to be fine. Anyone have this problem before or any ideas on what could have happened. Your help would be GREATLY appreciatted.

Thanks for the reply Tom, I checked every knob, button and switch today(if it moved, I moved it)and no change other than what you will see below. I remember for a while before it went, that from time to time the volume seemed to get lower and the signal would drop some so I would turn the volume up and down a few times or wiggle the knob a little it would come back to regular. The way this happened though was different. I accidentally hit the lock button on the MC-60A mic and it was on for a few minutes (about 5 or so in either in AM or FM mode on the upper part of 10 meters). What I did today was key my TS-2000 which sits on the shelf right above the 690 and although I got the normal feedback squeal from being that close I still got no signal what-so-ever, except the 2 bars seen when the AIP was on (I used different power levels). One other thing I noticed today was with AIP on I would see 1 or 2 bars on the S-meter with or without the TS-2000 keyed but with AIP off it all disappeared (with the TS-2000 keyed and AIP off I still got the feedback but no signal). I hope this extra info helps. I plan on opening it up tomorrow and look around the AF gain know and the board around it. I GREATLY APPRECIATE THE HELP.

I just bought a ts 850 and I have found it to be a better radio than I thought it would be. I have entered information into the cw keyer memories and would now like to clear the memory and enter new info. The operators manual explains how to write to memory but is not clear on how to erase the memory contents. I am sure I will be surprised at how easy this is.

Thanks

n0rz

If you check on www.qth.com, look through the advertisers index. There is a company there, the name escapes me at the moment. They make a rack to fit the 850.

OK Gang. Does anyone have any other ideas? I checked for separated components, cold solder joints and the antenna connection is fine. I looked into my log to find out where I might have been TXing before the mic became locked and it quit (in the event that has something to do with it) 29.510/610 in Newfoundland, good thing there was no propogation that day). The only other thing that I can come up with would be that switch that allows you to switch between HF and HF/6m. It's too good of a rig to just throw up in the closet and it makes a GREAT back-up for my TS-2000.

I don't think you can "erase" it per se (that is, I don't think you can blank it out). When you rewrite to it, it erases the old message.

At least that's what I do.

Frank,

Did you measure voltages on the TX & RX lines? In your radio you have TX8 and RX8 volts. There is a little sub-board off the IF board called the TRX board. It is responsible for switching the 8V to the TX and RX circuits depending on whether you are transmitting or receiving.Look for some test points on the IF board TX8 and RX8 or something to thsat effect. You could even measure on the TRX board itself if you know which pins are which. This is where I would start looking. It is possible the RX8 has gone dead.

Max

Thanks for the reply.

Yes the new info does replace the old, and I have rewritten my
info. I was thinking of a total erase, but can't say why that would
be necessary. If I discover a method of totally eraseing the memory
I will post it.

Thanks for some additional info Max, This will be a first for me. I know how to replace different things on radios, I can read schematics and even solder...hi hi but in 11 years in the hobby I have never done any voltage checks so I'll look at the schematics and try to locate what you have mentioned to me. That's what I love about this hobby, your always learning. Besides the radio isn't operating anyhow so if I blow it up I'll just finish what it did...hi hi. Actually if I dont think I can acomplish this I'll just send it to Kenwood East unless one of the members of our group is knowlegable on repairing these rigs.
Everyone have a GREAT DAY!

Frank,

I'll go through the service manual. The TRX board has an 8V input and switching outputs between TX8V and RX8V. It would be easiest to measure at this board. I had a similar problem with one of my 850's that wouldn't transmit. Sure enough, the TX8V was kaput. I just swapped out the TRX board, about $11 from East Coast Transistor. Fixed the rig up nicely.

Max

Frank,

The TRX board is number X59-3680-01. It is a small board mounted vertically coming up off the IF board. If you turn the rig over, with the front facing you, the RF board is on the left, the IF board is on the right. The TRX board number will be imprinted on the IF board where it is. Here are the voltages to check for:

Pin 7 should have 8V on it all the time

Pin 10 should have 8V on it in receive only (your issue??)

Pin 5 should have 8V on it only in transmit.

Pin 1 and 11 are ground.

I'm not sure which way the pins run, but if you count over from one end it should be easy to tell, find pin 7 first, the one with 8V on it all the time. It will either be 7 pins over counting pin 1 or 5 pins over counting pin 11. Hope that isn't too confusing.

Lets us know what you find.

Max

What if we put those page scans into JPG, and loaded them into a
picture folder? Would we loose much of them? Perhaps, but there
is plenty of space there.

Someone may have a utility to convert pdfs to jpegs. I'm not familiar with any. Took quite a
bit of time scanning these originally because of the many fold-out pages. Doubt jpegs would give you the resolution pdfs do anyway.

Gary

The files can live on that server for a long time, no need to convert or any other format.

If anyone else has large files they wish to share I have plenty web space and plenty bandwidth allowance and can arrange a ftp account for upload.

Hello All:

I'm attemting to roll my own IF232C to be used with a TS690SAT using a MAX232 IC to convert the TTL to RS232....

Is there anything on the rig side to activate the Data Port. I've not been able to get any connecton using Ham Radio Deluxe.

Thanks for any input

Bob,

I would suspect something in your wiring. Have you tried the circuit on any other radio? The radio is ready to go, nothing to select. I know the 850 had a menu setting for baud rate, I'm not sure if the 450/690's do as well.

Anyone else?

Max VE3TMT

what rates are you using to connect (or should I say attempt) default kenwood interface is 4800, 8,n,2

if you are trying to go higher baud rate, it may have trouble, as in getting garbage....

Yes, I have been using a MAX232 with a 7405 buffer/inverter for years with my TS-850. You can use a 7404/74LS04 or an opto-isolator instead of the 7405. That's just what I happened to have in the parts box at the time.

You have to turn RTS on on the radio side. You can either do this by passing RTS through the MAX232 and having your software setup for RTS Always On, or you can hardwire RTS to Always ON on the radio side of the interface and not pass it through the RS232. I believe you can either pull the radio's RTS up to 5V through a 10K resistor, or just connect the radio's RTS and CTS together. If you do this, that will leave the RTS signal from the COM port free so you can use it to control PTT through a switching transistor. Kenwood radios don't use DTR, so you can use it to key CW the same way. That gives you radio control, CW and PTT all on the same serial port, if your software will support it.

73,
Rich VE3IAY

From: w7tea
Topic: 4334 Message: 5113

I now have four HF rigs in a small shack. Selling my 850 and probably an Omni VI+ later. I am original owner of the 850s/AT, non smoker, purchased in June 1991. Serial number 20800237. Never have had a problem. Used for CW primarily and PSK31 of late.

Has three additional optional filters: 2.1 khz International Radio filter in 8.83 IF and 400 Hz CW filters in 8.83 and 455 IFs. Bill, K0ZL, (www.amater-repairs.com) replaced the battery (no leakage), did the NB and sidetone mods, DC-DC mod and aligned about a year ago.

Original box, manual and service manual. Also SP-31 speaker, power cord and all the connectors I can find. Will throw in MC-85 and MC-50 free. Not used either mic in years.

One issue. There was a smudge on top of the front panel. I stupidly cleaned it with alcohol and rubbed the grey paint off--so now there is a black spot. Pics available on my public .mac folder (idisk.mac.com/gtuck-Public). Pics make it look worse than it is. Asking for $700 plus shipping and insurance from 97230.

Please reply off the list to w7tea@...

73, Gary W7TEA

5114. Can't get the tuner to work ts-450s

Yahoo group: TS-850_450_690 (2006 — 2009)

I left the rig in storage for about a month, only to find when I turned it on the microprocessor appeared to be reset. None of the installed filters worked, the same for the internal tuner and all memories were gone as well. The rig powered up on 14.000 USB. Sounds like a dead battery to me. My question is how do I reactivate the tuner? I don't have my copy of the users manual handy and I don't remember how to get into the microprocessor settings.

Hold down the A=B button while turning the rig on. This will reset the
CPU. Of course if the battery is dead it won't do you any good if you
turn the radio back off.

I noticed the tuner in my TS850S/AT was louder than usual over the weekend. It has a distinct gear sound. Sounds to me like I better service the tuner soon.

Has anyone done a removal, lubrication, and replacement of the tuner? Is this covered in the TS850S/AT service manual? Is this something easily done by the ham or do I need to send it to a repair shop? I've had my TS850S/AT for 11 years and it has never been opened except to install filters.

I figured out what was going on. I also had to turn the filters back on today and I turned on #1 in the filter menu when I shouldn't have. Now the tuner works just fine.

I'm not really sure what #20 has to do with making the tuner work. I thinkwe might be talking about two different radios. This one is a ts-450s

I thinkwe might be talking about two different radios. This one is a
ts-450s

If the menu system is the same as the 850, # 20 selects either
automatic or manual control of the tuner. If it was in manual mode the
tuner wouldn't start tuning unless you do it yourself, by turning the
VFO knob and the MEM.CH knob.

5126. TS-850 front panel keys

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-09-19 17:59:01 UTC
From: merckxist
Topic: 5126 Message: 5126

Does anybody know if replacement front panel keys are availiable for the TS-850, and if so, where? Some of mine are getting worn, particularly the USB/LSB, CW/FSK mode keys, and the "0" and "ENTER" keys on the keypad.I couldn't find anything in the message archives or files, any advice appreciated.

I do have some spare ones. Got them from Kenwood UK, about 5 years ago. Do not know if still available. Other one is Pacific parts in US.

Al,
Try http://www.kenwoodparts.com/ aka East coast Transistors.
They did have quite a stock of these buttons last time I ordered.
Cheers,
Terry

Al,

If you plan on ordering the buttons, order the foam that goes behind them. This is what holds them in place in the panel and unless you are extremely careful you will tear the foam taking the old ones out. It is very cheap and would be worth the trouble just in case.

Hi,
I am using a TS450S with european bands, so transmission is blocked above 7,100 MHz.
A few months ago we got use of 7,100-7,200 MHz in PA
Is there a menu someplace or a modification where I can get to use p.e. the US bands or VK bands?
Have looked at mods.dk but nothing useful there.
Help will be greatly appreciated

Topic: 5145 Message: 5145

My TS-850 transmits in FSK (RTTY), yet the TNC (PK-232) does not indicate received signals. The TNC functions with my other rigs. This rules out the cord from the TNC and the associated plug (13 pin male).

Should I check the ACC2 port in the 850, or should I check elsewhere?

Thanks and '73,
Randy WN9D

(Randy: there is a note for you about 6 paragraphs down the page)

Dave,

You don't have to use narrow filters in FSK. You can use the wide filters when conditions permit.

I do quite a lot of RTTY contesting. I find it impossible to use ssb filters in a big RTTY contest like last weekend. There could easily be four or five QSOs audible within the ssb filter bandwidth. In fact, even 500 Hz is a bit too wide when there is heavy QRM; 400 Hz or 350 Hz is better. 250 Hz is a bit too narrow.

The TS-850 allows you to use the narrow filters in SSB, but they are centered around 1450 Hz instead of 2100 Hz as in FSK. This is fine for sound card AFSK, but may not be compatible with some TNCs.

Tuning accuracy: when you are CQing in a contest, most responders are within less than about 40-50 Hz, with only a few farther away than that. If they are much farther away, there is a strong possibility that they are answering someone else's CQ, not yours. You can use the RIT to make fine adjustments for people who call you within up to a couple of hundred Hz of the correct frequency. If someone is farther away than that, in a contest I don't waste my time trying to work them unless things are really slow and the band is really quiet, i.e. almost weekday conditions. Those are the only times when wide filters are OK.

While searching and pouncing, I use my ears to get fairly close, and then the MMTTY tuning aids to do the rest. Even when I am using a TNC, I always have an MMTTY window open as a second decoder (MMTTY is a better decoder than most TNCs) and as a tuning aid (ditto). Set MMTTY's FFT bandwidth to 500 Hz, the XY scope to large, with reversed rotation direction, push the FINE button on the front of the TS-850, and it is not hard to tune in a station to within 20-30 Hz in a couple of seconds.

None of this answers Randy's original question. Randy, before ruling out the cable from the TNC with the 13-pin connector, what other radios does it work with? Are they Kenwoods as well, and if so which models? There are some Icom radios that use the same 13-pin DIN connector, but the pinout is incompatible, and I don't believe the same cable can be used with both.

73,
Rich VE3KI / VE3IAY

5148. TS-850 Weird Problems

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-09-28 00:22:04 UTC
From: Zack
Topic: 5148 Message: 5148

I powered up my TS-850 today and it is now doing something very strange. Now the display blanks out and I can hear a relay madly clicking. Sometimes when it powers up the numeric display changes to all dots and then the display dims a lot. If I turn the VFO it sends CW at a rate to rapid for me to copy and then the display changes back to all dots. I reset the CPU but it made no difference.

Has anyone out there seen anything like this before? Any idea as to where I can get it fixed?

Any info on this will be greatly appreciated.

The first thing to do is try a reset (A=B and power on) If no go then;

The first place I would look is a leaking battery. It sits on top of
data lines from the processor and when they get damaged all bets are
off as to what the radio will do. I've seen them do a little bit of
everything.

And yes I repair them

Clif

Hello,<?xml:namespace prefix = o ns = "urn:schemas-microsoft-com:office:office" />

I need some information about TS-950SD (Digital).

It has 10590963 serial number, which year was it manufactured?

Difference between TS-950SD and TS-950SDX?

Can SD be upgrade to SDX?

IS any difference in receiver performance between TS-950SD and TS-850S?

I think that TS-850S has very good receiver, what about TS-950SD.

Thank You

best to download the sales brochure, but I beleive the sd can NOT be upgraded to an sdx.....

If I were to comnpare it with anything, I would say compare to an 870 kenwood, because of the built in dsp, OR an 850 with the dsp100 option.

oh, and internal power supply, as opposed to external...

Difference between TS-950SD and TS-950SDX?

Can SD be upgrade to SDX?

IS any difference in receiver performance between TS-950SD and TS-850S?

I think that TS-850S has very good receiver, what about TS-950SD.

Thank You

Any website with the sales brochure?

Thanks

I have the QST reviews of the TS-950SD (Jan. 91), TS-850S (July 91), TS-450S/690S (April 92) and TS-950SDX (Dec. 92) in front of me. Based on the information in these reviews:

The TS-950SD is basically the TS-950S with the DSP module, TCXO and four additional IF filters built-in, i.e. it's an easy field upgrade from the 950S.

The TS-950SDX is really an entirely new radio. It is not possible to upgrade from the SD to the SDX. The DSP is much more closely integrated into the radio. The front panel is different (the photos where you can't read the labels on the controls look about the same but the user interface is improved). The sub-receiver is much improved. The finals are FETs instead of bipolars as in the TS-950SD.

The receiver lab test performance numbers for the TS-950SDX (MDS, blocking and IMD dynamic range) are not quite in the same class as the TS-850S, TS-940S and TS-950S/950SD, though.

Thank You Rich.

So, TS-950S/SD has better receiver then TS-950SDX. Is the TS-850S's receiver better choice for contests (my primary interest). I'm not really interesting or not needed to have sub receiver, but main receiver should be good for contesting.

DSP is not of interest either. I still trust the crystals filters.

Thanks

>I have two ts 950sd's two ts 850sat's and two ts870sat's

the 850's and 950's i really can not tell much of a differance in the
rec. a kewood tech told me once the the 850 was the 950 with out a
build in supply. i do not know if he was right or not but. the 850 is
one of the best contest rigs i have used. i still like the 950 and
850 over the 870. as for the ts 2000 been there done that got rid of it.

While you may be reading reviews you need to remember the margin of error in the tests, is large.

The receiver lab test performance numbers for the TS-950SDX (MDS, blocking and IMD dynamic range) are very much better than the TS-850S, TS-940S and similar to TS-950S/950SD.

Read the 950sdx reviews on Eham.net.

Even the right 830s can hear better than current many top line radios.

Look at

http://www.sherweng.com/table.html

The receiver was little changed between the 950s and 950dx

I have an 950sdx along side a 940s. Both receivers have similar sensitivity, but the 950sdx has better close in signal rejection.

The DSP of the 950sdx is truly wonderful and it is very quiet.

Outboard DSP on a TS-940 gives similar performance.

Remember the 950sdx is now 13 years old, an still commands $2,000 or more on EBay.

Reason is it has a great receiver., and of course dual receivers which are important for contest operating

Yep...it's a great rig !!

I'm going to make an adapter for my Astatic
DA 10 I have so I can use it on the 850 as
well as the 830s. I may be able to use it on
the 660 too. That would sound pretty good on
6m...

I just picked up a used Kenwood TS850 (supposed to be here Friday) which didn't come with a hand mic, so I am looking for one. Anyone have an extra hand mic for sale?

Also, is the TS850 as good as all of the reviews I have read? Make it sound like an excellent rig.

Can the Kenwood TS850 also use the DRU3A or only the
DRU2 voice recorder? And do you have to have the DRU2
installed for CW memories, or is the memory keyer
separate? Some of the reviews on the rig have been
unclear on this point.

Hi Guys,

I fired up the 850 after a few months of not using it. I only have a dipole antenna and usually listen to 40 meters and sometimes 20 meters. At first I thought the bands were dead but after 2 weeks, I only get a solid S9 of noise and occasionally a weak signal buried in the mud. When I tune the antenna, I get a quick,perfect swr 1, so I don't think it's the antenna. My rig hasn't moved and nothing has changed in the room/house. I'm in San Jose, Ca. and usually get lot's of activity. Are the bands dead or do I have a problem?

thx

bob

Subject: [TS-850_450_690] Does my 850 have a problem?

Hi Guys,

I fired up the 850 after a few months of not using it. I only have a dipole antenna and usually listen to 40 meters and sometimes 20 meters. At first I thought the bands were dead but after 2 weeks, I only get a solid S9 of noise and occasionally a weak signal buried in the mud. When I tune the antenna, I get a quick,perfect swr 1, so I don't think it's the antenna. My rig hasn't moved and nothing has changed in the room/house. I'm in San Jose, Ca. and usually get lot's of activity. Are the bands dead or do I have a problem?

thx

bob

Topic: 5162 Message: 5167

The CW memories work without the DRU-2. You must have the rear panel switch set to electronic keyer. The manual says you need a DRU-2 to do this, but they work on my TS-850 (S/N 70xxxxxx) which does not have a DRU-2 installed.

My manual only mentions the DRU-2, not the DRU-3A.

Topic: 5161 Message: 5168

Hi John,

It☐s good to see you pop-up on occasion. Yes, the TS-850S is as good as everyone says. If you latch on to a good one, please hang on to it and keep it running. The receiver in this "pinnacle of analog technology" really is something to behold. The receiver is extra sensitive ☐ too sensitive most of the time. I use the AIP or 6 or 12 db of attenuation, as well as the RG gain control most of the time ☐ especially on the low bands. Its selectivity and slope tuning capabilities, with optional installed INRAD filters, is as good as anything out there, with the exception of the latest rigs with analog roofing and IF filters, and DSP technology, such as the ORION and FTDX series, and the IC-7800.

It☐s quite possible the new FT-2000 may give the receiver in the 850 a run for the money, but I seriously doubt it. Even though, I☐d love to be able to afford one sometime soon. I might be moving back to the lower forty-eight, maybe we could hook up then?

73,

Steve Gehring, NL7W
Ex: NT0J and N0EYO

I just picked up a used Kenwood TS850 (supposed to be
here Friday) which didn't come with a hand mic, so I
am looking for one. Anyone have an extra hand mic for
sale?

Also, is the TS850 as good as all of the reviews I
have read? Make it sound like an excellent rig.

ck the antenna attenuator, if switched on
Recently I had the same problem , but on 21 Mhz. It was propagation. I am using a 40 m delta loop, and on 15m it is quite directional, east west. As most signals arrive north-west, I thought I had something wrong with the rx.

How do I check my antenna (for noise) besides doing a SWR test? It's a
dipole made from 12 gauge wire that just lays on my roof.

thx

Not that, still a solid S9 of noise on 40 meters. Maybe it is local noise.
If so, is there anythingI can do? Move? :)

When I lived in the city the noise floor was always
S9 to S9+40. When I moved to a rural area the
noise floor dropped to S0 - S2....

When I work weak stations the S meter sits on S0
and barely moves if at all when making a contact
but the QSO is still clear above the noise.

The TS850 has no input mains filter. Sometimes the local QRN is so high that it masks most signals. This has happened to me. I have fitted a mains filter, salvaged from an old tv, consisting of a ferrite ring and two caps. The two ferrites connected between the rig and psu is not enough to kill most qrn !

5175. FI-7000 band change

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-10-06 16:43:06 UTC
From: cubpack355
Topic: 5175 Message: 5175

Karl,
Did you ever get your 850 to 7000 solution?

5176. TS850 and autotuner

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-10-07 20:07:37 UTC
From: John Geiger
Topic: 5176 Message: 5176

I got the TS850 I recently ordered in yesterday (used, of course) and the autotuner doesn't seem to be operating as the manual states it should. It will load up antennas-better than most autotuners I have seen, but it won't stop tuning once it has found a good match. It will continue to tune and eventually start sending 5 dits.

What am I missing here? I can get it to stop tuning once it has a good match by pushing the AT Tune button again, but it won't remember the match when I change bands and come back again. I checked the hidden menu functions (power on while pushing TX-MEM and SCAN) and it is set to stop tuning when it has found a match.

Anyone have a solution to this deal?

73s john W5TD

P.S very good receiver on this rig. I am impressed so far.

Hi John,

Make sure you have the power cranked up a ways. The tuner will act haywire if you aren't running enough power through it.

If that's not the problem, it's probably more serious. I'm assuming your antenna should be within range of the tuning? My 40m dipole won't tune on 160 but I expected that. :-)

There is a function in the extended function menu that
puts the tuner into non-stop mode. Cannot see why anyone
would want to do this, except maybe for testing.

To access this extended function menu, press SCAN and
TX-M.CH and power up the radio.

The M.CH/VFO CH knob scroll through the 8 functions in
this menu.

You want menu item 03. Set it to OFF.

Hope this helps.

Hi John,

THanks for the info. ALready tried that, and it was
set correctly. Someone on the Kenwood list mentioned
that the CAR control needed to be fully clockwise.
Tried that and it now works!!

Define a "good match" it's set to stop at 1.2-1. If it's not getting
that low it's not happy and won't stop. What does it do into a dummy
load? It should be almost instantaneous.

Hi
I have the same problem, switch off in hidden menu, car key fully clockwise etc. everything done.
Sometimes it hepls, if I enable manual tuning in menu 20, then tunig manual, after then automatic tuning enabled, the tuner switch off, such as the motors of the tuner do not find the end position, in automatic mode there is an anoying rrr rrr rrr, the SWR at this time is better 1:1.3.
Any ideas

The auto tuner of the ts850 has a limited range of impedances that it can tune to, only up to 150 ohms. It all depends on your antenna system.

Paul

5183. TS-850 Filter Alignment Fun

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-10-08 23:13:12 UTC
From: Dave
Topic: 5138 Message: 5183

Hi -

My TS-850 has an odd problem with the filters on CW. When cycling the 8.83 and 455 filter settings from 2.7 to 500, the passed audio frequency shifts.

I captured this in a Digipan waterfall and posted a picture at http://www.zievid.com/850Test2.GIF. You can see how the passband shifts with both set to 500. The middle section has 2.7 selected for 8.83, and 500 for the 455 IF. The bottom shows both at 2.7.

This doesn't seem right. I assume my CW sidetone/offset isn't changing, so this passband shouldn't be shifting around. On some bands it seems CW reception is excessively narrow.

The filters I have are:
YK-88C-1
YK-88SN-1
YG-455CN-1

The switch settings under the top panel are 'on' for 1, 3 and 4.

Any ideas on what's wrong? Is it possible to align the filters better?

Thanks,
- Dave

Hi
decided to run psk and maybe some other digital modes on my 850. Is there a interface that does not use the mic connector,but uses one of the din jacks on the rear of the rig. I noticed most of the infaces that connect via the mic and have provision for switching etc are all 150-200.00. If one of you guys are doing what I want to do and doing it thru the rear connection, please enlighten me as to what your using. Also what is one of the better performing psk31 software programs. Grateful for any help on this,don't want to reinvent the wheel.
thanks

Hi Dale -

I built a "breakout box" for the TS-850 back connector and put in jacks to feed audio to and from a laptop.

The circuit uses two 1:1 transformers for isolation and have an attenuator to adjust the levels. You can see a variety of circuits like this at http://www.qsl.net/wm2u/interface.html

Digipan is one of the most popular PSK software. It works well and the price is right (free).

With that interface, you can use PSK, SSTV, RTTY and other digital modes with various software.

Hope this helps,
- Dave

Dale:
check the help or interface files on any of the psk or rtty software you can download for free. they have the parts an layout for the interface you want. it goes into the Din on the back of the 850. will cost you about 12.00 in parts 20.00 at the most. i have build a dozen of these in a 25 pin serial cable connector or you can put it in an 2x2 box.
just about every program i have seen has this info. or there is a webpage forgot what the address is but you can do a google search for psk/rtty interfaces.
good luck

For sound card digital modes, the 13-pin DIN ACC2 jack on the back of the radio supplies all of the inputs and outputs needed.

If you already have your radio interfaced for computer control via ACC1, the only connections you need are audio in and out (you can do PTT by computer command). I operated sound-card digital modes for several years and made several thousand AFSK RTTY and other digital mode contacts using only a pair of audio patch cables with mini-stereo phone plugs at the computer end wired to a 13-pin DIN plug for the radio. Those 13-pin DIN plugs are awful things to solder to, though.

If you also want hardware PTT from a serial port, the Buxcomm Rascal interface with the KW13RYR cable connects to ACC2. If you don't have a spare serial port, they also sell a model with a USB interface.

One tip: many 13-pin DIN plugs don't seem to quite fit ACC2. The problem is the shell, not the pins. If you remove the top half of the shell (these plugs generally have a shell made from two semi-cylindrical pieces of sheet metal), the plug goes on a lot more easily.

As for software, I prefer MixW, but it's not free. MultiPSK, MMVARI, WinWarbler and PSK Deluxe are all free. The last two use the same decoding algorithms (the PSKCore dll) - in my view the other three programs I mentioned all outperform PSKCore (decode weak signals better), but in the final analysis most people end up choosing based on the user interface, not the technical performance.

The way the software performs will also depend on your sound card. The motherboard AC97 sound devices get mixed reviews at best. The old Creative PCI-16 sound card does a better job on amateur radio modes. You do not need an expensive sound card with fancy audio sound effects - for the most part all you are paying for is audio processing features which you will have to disable. From the point of view of digital modes for the radio, they only add distortion.

Hello,
For months I was using my TS-850 with an MFJ Kenwood data cable to connect my PC to the rig. It worked fine in WriteLog and Ham Radio Deluxe.

One day last year, of course just before CQ WW DX SSB, I went to look over the shack prior to the contest and noticed that I could not see the righ in WriteLog.

Long story short, I've been though everything I can think of among them;
- A new PC motherboard (about time anyway)and a different laptop to rule out the serial port.
- Numerous resets of the 850; full and partial.
- Different programs including using Hyperterminal (4800,N,8,2) and all I get is errors.
- Different cables, I tried a known working W1GEE interface cable and had MFJ check the cable I had, no change in result.

I'd like to hear any comments anyone might have about my situation. Also is this something I can repair myself (replace chips, a board etc.)?

Thanks in advance,
Peter

The one thing that springs immediately to mind is that Kenwood
requires the RTS signal from the COM port to be asserted. If your
software has an option to turn RTS to "Always On" and you are not
already using it, try that to see if it solves your problem.

Since you are using a commercial interface, this next possibility
may not be workable for you, but I have seen some people recommend
simply jumpering ACC1 pins 4 and 5 together without connecting
either of them to the interface, which frees up RTS at the computer
end to be used for some other purpose such as hardware PTT switching.

One note...Some software programs use the RTS line for PTT. If you
change it to always on, your rig will stay in TX mode.

Hi Dale -

Check out http://www.digipan.net/ You can get the download, some docs and links to places for various help. It will work right out of the "box", but you have to have the PC sound configured so the mic or line in is enabled and has the volume up a bit.

Just for fooling around, if you have a microphone (from a headset/mic combo) that works on your PC you can just put it right in front of your speaker and play with the software.

It's ugly, and you can't transmit, but it's usable for just checking out software and seeing what's on the air.

Max,

We are talking about two different serial ports here. Most people have two separate interfaces, one for radio control (such as an IF-232), and one for sound card interfacing PTT (such as the Buxcomm Rascal). These are normally plugged into two different serial ports on the computer. I was talking about the computer interface port, while you are talking about the sound card/PTT interface port. RTS on the serial port that the IF-232 is connected to must be always on. RTS on the serial port that the Rascal is connected to is used to control PTT.

It is possible to combine the two into a single port if you build your own interfaces for both, and if your software is flexible enough to use the same port for both (some software won't let you do that). In that case, you can break out RTS from the computer's COM port and connect it to a keying circuit that controls PTT. In order to make communications work you have to find another way to hold pin 4 on ACC1 high - the easiest way to do that is to jumper pins 4 and 5 together.

73,
Rich VE3KI

Subject: [TS-850_450_690] psk interface for 850

Hi
decided to run psk and maybe some other digital modes on my 850. Is there a interface that does not use the mic connector,but uses one of the din jacks on the rear of the rig. I noticed most of the infaces that connect via the mic and have provision for switching etc are all 150-200.00. If one of you guys are doing what I want to do and doing it thru the rear connection, please enlighten me as to what your using. Also what is one of the better performing psk31 software programs. Grateful for any help on this,don't want to reinvent the wheel.
thanks
dale wt4t

Subject: [TS-850_450_690] TS-850 Dead ACC1 Port?

Hello,
For months I was using my TS-850 with an MFJ Kenwood data cable to connect my PC to the rig. It worked fine in WriteLog and Ham Radio Deluxe.

One day last year, of course just before CQ WW DX SSB, I went to look over the shack prior to the contest and noticed that I could not see the righ in WriteLog.

Long story short, I've been though everything I can think of among them;
- A new PC motherboard (about time anyway)and a different laptop to rule out the serial port.
- Numerous resets of the 850; full and partial.
- Different programs including using Hyperterminal (4800,N,8,2) and all I get is errors.
- Different cables, I tried a known working W1GEE interface cable and had MFJ check the cable I had, no change in result.

I'd like to hear any comments anyone might have about my situation. Also is this something I can repair myself (replace chips, a board etc.)?

Thanks in advance,
Peter

Rich,

I used a homebrew interface for PC control, including PTT functions and could not have RTS set on all the time. What I said was is your software program requires the RTS line to switch for PTT and you set it to on all the time, the rig will be in TX all the time. I realize this has nothing to do with the ACCY port for the audio lines and I was not implying that. In my setup I did not use the PTT lines in the 13-pin DIN setup, I used the RTS line to key the radio.

5201. TS 850 TX frequency in 2,44Khz Steps

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-10-14 22:01:13 UTC
From: Peter
Topic: 5201 Message: 5201

I have recently bought a secondhand TS850s
However it seems to have a fault where the TX frequency only changes
in 2.44KHz steps in ssb, and 7.34KHz steps in FM.

Recieve frequency is perfect.

I found slight reference in this list to DDS chips being a possible cause!

The previouse owner said that one had been changed.

I am still waiting for his response to the problem.

The serial number of the radio is 30500052, so wouldnt this have the
newer dds chips in?

What are the implications if it is the DDS chips, (cost, availability)

Any help or advise warmly welcomed.

I am in the UK

I have a TS-850 s/n 302000xxx that had the old chips (6631s) in it. The
chips had a 1991 date code. I recently replaced the entire board.
>
> What are the implications if it is the DDS chips, (cost, availability)

I obtained an entire CAR board (the one with the four DDS chips on it)
from East Coast Transistor for a little over $200 USD.

John

Thanks for the lead, very good site that I had no knowledge of.

I guess it is the DDS chips, as also the 'moni' function does not
work, and again it has been noted that the DDR chips control this.

I have made contact with the seller of the radio, who apears genuinely
suprised and sympathetic, so will now see what he will do to resolve
the problem.

Thanks again

Peter

As for why it doesn't affect receive.

The 6631 is a dual chip, each side identical. One side is used in RX
and the other in TX. Either side can malfunction and not affect the
other. I have seen this several times.

Topic: 5205 Message: 5205

I just purchased a non working AT-250. The seller told me he had been useing it in the manual mode with a TS-430 for a long time[did't have the din cable] and then it got to where it would't match his antenna.He let it search for a match for a long time and then it quit.Power lite comes on.I manualy choose the band[here relays] and antenna /turn the tuner on and lite comes on/press the tune button [this lite never come on] and the tuner lite goes off. The motors don't turn and I see no voltage on them.I do have a POOR service manual for it.The meter shows aprox. rf out with the TUNE and TUNER buttons out and dummy load connected. Any ideas as to a starting point for trouble shooting?Tnx for any info that can be passed along . Mike [K5BOX]

Topic: 5207 Message: 5207

Hi all,
I've been very busy at my work lately... so almost no time for the radio
:-((

Last night, I turned on my TS-850S, I found some (yes.... some) problems :
1. The display did not turn on directly after I turned on the radio. Need
more than 45 second for the display to show up its beautiful digit.
2. The receiving audio (from the speaker and from the headphone) did not go
loud for more than five minutes. Although I tried to set the volume control
to the maximum setting. Then the sound came up slowly.
3. After the display came up normally, the dim function did'nt function. It
seems like the display always at "bright" setting.
4. On 20.995 MHz rx sensitivity was normal, but when the bandpass filter
automatically changed to 21.000 MHz, the rx sensitivity is reduced about 2 S
unit. It behaved like that on the bandwidth range of 21 MHz bandpass filter.

Any one ever experienced the same problems with me? Please kindly tell me
where to start solving these problem?

Thank you.....

YC1EME-Budi

Thank you for the reply.....

I am quite sure, that it has a RX sensitivity problem.
I compare the noise level, between 20.995 MHz and 21.000 MHz.
Yes, it is 2 S unit different.
On my TS-50S, I don't see the difference of noise level between 20.995 MHz and 21.000 MHz.

Maybe I should start from the bandpass filter switching.....

On my last 850 the receiver noise would drop from about S4 on 19 Mhz
to S-0 on 22.00 My TS830 doesn't show this problem.

are you sure the signals are not being masked by local qrn ??
The ts850 has no adequate mains input filter. I had that problem, and cured it by fitted a mains input filter salvaged from an old tv set !

I think 20.995 MHz and 21.000 MHz should be no big different in noise level.
My TS850 and TS50 have almost same S meter calibration.
On other band, for example on 10 meter.
I could receive a station with signal strength S7 while the noise level is
S4 on TS 850
on my TS 50, the signal strength and noise level is also at the same.
But, on 15 meter, the TS850 signal strength is about 2 S unit different.
And I could hear the different noise level between 20.995 MHz and 21.000 MHz
from the speaker.
On 20.995 MHz, the noise is a little bit "louder".

OK, I have a long holiday here.. start from tomorrow..
I should have time to find the problem cause.

Thank you.

5218. FS: Kenwood CW filters

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-10-21 14:57:13 UTC
From: John Geiger
Topic: 5218 Message: 5218

I have a pair of 500hz CW filters available for
Kenwood rigs. I have the YK88C-1 and the YK-455C-1.
The first filter will also fit in the 570 series of
radios. The second filter with fit in the 140/680
series of radios. Both filters will work in the
930/940/850/450/690 radios. I am asking $70 shipped
for each filter or $130 shipped for both together.
Can take check/MO/Paypal

From: John Geiger
Topic: 5219 Message: 5219

Is the autotuner in the 450/690 as good as the one in
the TS850-meaning that it loads up about anything, and
is much better than the internal tuners in current
rigs?

The internal tuner of the ts850 can only load up to 150 ohms unbalanced, and it only works on transmit, not on recieve

It is more of an add on rather than a modification.
You open the power supply of the TS850, find the mains wires going to the mains transformer and on/off switch, cut the live and neutral wires and insert the mains filter just before entering the primary of the mains transformer. Thats it.

I am using a filter salvaged from a tv set, made up of a ferrite ring with a pair of windings on each side, and two main capacitors. You can find ready built ones easily.

5229. TS-450SAT receive low

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-10-25 03:45:12 UTC
From: Tom Osborne
Topic: 5229 Message: 5229

Hi All

I have a pair of TS-450SAT's and one of them is real weak in receive.

I can tune in a station on radio 1 and it will deflect the S-meter to S-9.

On radio 2 I can tune in the same station the S-meter will show about S-3.

I can switch the RX M button to read db and both radios will show the same deflection, from -20 to about the zero mark, but signals are WAY down on radio 1. Any ideas ou there? Thanks and 73.

Hi Peter
I had a similar problem with a TS-690SAT (See msg.4629)
I bought 2 new DDS-chips at http://www.kenwoodparts.com
Part# is YM6631 and the price is $28.
After replacement the radio worked fine again. Although one DDS-chip
was still working I chose to replace both to avoid the reliability
problems.

Good luck!

Put tape over both s-meters. Tune in weak signals and listen to both radios. Let your ears not the s-meter tell you if one is down in Rx. Be honest with yourself. If one is down you can find it.

Don't depend on the s-meter to determine a radio is down in RX, they can be adjusted anyway you like. I see a lot of radios that although the s-meter reading is great when put on a signal generator they are deaf as a post. Someone tweaked the s-meter to sell it.

Lars

Thanks for input.

I have just got the radio back from repair.

It was found that two DDS chips had gone faulty, one controling the VFO, I think 4.00MHZ, and the other controling the "Moni" function (8.00Mhz).

One was replaced, and now I am ordering two more to replace the faulty chip, and the last unchanged DDS chip. Three chips have gone faulty in about 3 months!!

Now I can use the radio, I find it superb, and await the CQ WW contest eagerly!

Regards

Peter

5234. TS-850 transverter interfacing

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-10-28 13:37:49 UTC
From: Scarlett
Topic: 5234 Message: 5234

I'm working on a transverter interface for my TS-850S, which involves a relay to supply the +8-12VDC bias to the IF 1 OUT port. The manual says "supply DC voltage to this port and the relay activates". My question: does supplying the bias voltage merely *enable* the low-level TX output at the IF 1 OUT, or does it also perform the changeover to TX for the radio? Another way, once I supply the bias voltage at IF 1 OUT, do I still need to PTT the radio in some fashion? Thanks,

5235. Re: [TS-850_450_690] TS-850 transverter interfacing

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-10-28 14:04:49 UTC
From: Zack Widup
Topic: 5234 Message: 5235

Applying the voltage to the IF OUT 1 connector merely switches internal circuitry to enable output from that connection instead of the ANT jack. The radio controls the transverter and not vice versa. You would use the radio normally as you would on HF with the mic or the key/keyer inputs to transmit.

The REMOTE connector has a relay on pins 2, 4 and 5 that can be used to switch power for the transverter T/R function.

I've found the Down East Microwave TIB-850 interface kit for the TS-850 use with transverters to be well worth the money and does a great job of interfacing transverters to the rig.

Hi Tony,

If you have the Slope Tune controls set incorrectly, it could cause that.
The outer knob should be fully counterclockwise and the iner knob should
be fully clockwise.

If you still hear the opposite side of the signal in CW mode, something is
out of alignment.

Kenwood rigs. I have the YK88C-1 and the YK-455C-1.
The first filter will also fit in the 570 series of
radios. The second filter with fit in the 140/680
series of radios. Both filters will work in the
930/940/850/450/690 radios. I am asking $70 shipped
for each filter or $130 shipped for both together.
Can take check/MO/Paypal

Thanks Zack,
I've checked the settings of the slope controls, but still hearing the other side of the signal. I'll leave the alignment alone as I've not got the kit here to make a decent job of that.

Hi Tony,

If you have the Slope Tune controls set incorrectly, it could cause that.
The outer knob should be fully counterclockwise and the iner knob should
be fully clockwise.

If you still hear the opposite side of the signal in CW mode, something is
out of alignment.

Hi Tony,
which combination of filters are you using for CW?
By changing of this combination is the behavior the same?
just question...

<snip>

Hi Lexa,
the 850 has 500 and 250 Hz in first IF and 500 Hz in second IF
Changing the filters does not change the reception of part of the
other side of the filter.

Thanks very much for your help on this

5244. Bad CW filter?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-11-02 05:41:50 UTC
From: John Geiger
Topic: 5244 Message: 5244

Here is an issue I haven't seen discussed before. Is
it possible for a CW (or SSB) filter to go bad? I
recently bought a used YG455C-1 500hz CW filter from a
ham dealer. Installed it in my Kenwood TS690, and...
nothing! I turned the filter on in the menus, but I
hear nothing when putting it in line. Could the
filter be bad? Is there something rig related that I
am missing to get it to work?

John,

Hi.

If its gone in the right location, then it sounds like the menu settings
might not be correct? Other than that, I can't offer an explanation. I
guess the filter could be duff, but not sure what can really go wrong
with them...

Remove the filter and look very closely where the pins are soldered to
the PCB. After numerous insertions it's common for the trace to crack
from removing the filter by grabbing it rather than the PCB. If you
can't see a crack then resolder the pins. If it's cracked the pad
around the pin will come loose. This is the most common problem. I
have seen bad filters but very few.

Hi John,

If worse comes to worse, find someone with a spectrum analyzer (w/ tracking generator) and check its bandpass characteristics. Granted, there will be an impedance mismatch, but this avenue should work, as long as you don't apply too much juice to it (equal to or less than 0 dBm). I'd dump -20 dBm into the filter for checkout. 73.

5251. Another filter question/problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-11-04 23:51:24 UTC
From: John Geiger
Topic: 5251 Message: 5251

I just installed a Kenwood YK88C-1 filter in my TS690 in time for the November SS (thanks to Associated Radio for sending it priority mail so I could have it by contest time). However, when I put the filter in line I have to turn the IF shift completely to the right to put it on the right receive frequency. It is fine with the filter out of line, where the IF shift is centerd, as it is supposed to be. Also, with the filter in line I was hearing some loud stations on the other side of the zero beat.

This is a used filter, so I have no idea as to its history, but anyone have an idea as to what is going on? Is it the filter or the rig that is out of alignment here?

Guess it isn't my week for CW filters.

I have a similar issue with a SSB narrow filter.

Check here:

http://groups.yahoo.com/group/TS-850_450_690/message/4509

As you can see there is no unanimity in the replies about if that is
an issue or not. However I also have a YK-88CN-1 and it works fine
without moving the IF shift.

You are correct-there is no internal keyer in the
450/690. A great oversight by Kenwood on an otherwise
great rig.

I have for sale an MFJ 8044 IC electric keyer. It does both grid block (tube rigs) and direct (solid state rigs) keying. Has controls for speed, weight, tone, and volume (for its built in speaker), and also will do semi automatic keyer, with a steady carrier tune position. It runs off of a 9 volt battery and I will include the cable to go between the keyer and the rig. With the built in speaker it would also make a nice code oscillator. I am asking $30 plus shipping.

Hilary,

You need an RS232-TTL converter between the radio and serial port. You
cannot hook the radio directly to the computer.

you will need the if232c option mentioned in the manual, or an equivelent. check the web for if232c cloes, some are serial, some are usb, you have to figure what your computer will be ok using

here is one example

Hi!
I use just one 5V zener diode with the 470 ohm resistor.
The Ham radio deluxe and N1MM Loger works perfect
(some says its works with the N6TR logger to.
Half of Slovenian TS850 users used this scheme from K6LL.
It can be found on mods.dk, or if you want I can
e-mail the scheme to you.

5269. 850 DDL board

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-11-17 12:23:37 UTC
From: DAVE ...M0BZK
Topic: 5269 Message: 5269

Hi, I have just had my repair shop on to me after I had taken my dead 850 in for repair, sending cw UL, they have said that caps had leaked on the DDL board and had taken out the 3 IC's. The cost of repair is estimated to be around £230. does anyone know the availability and cost of the IC's or if another board is available as the cost might mean I have to scrap the rig.

Dave, I recently replaced the DDS board (CAR board) in a TS-850
S/N 301xxxxx

Purchased from East Coast Transistor for about $210
(ref: http://www.kenwoodparts.com/)
The CAR board is p/n X50-3140-00
Don't know how difficult it would be to get this shipped into
the UK.

Changing the board is very easy. Replacing the DDS chips is
pretty exacting work - high pin count small pitch surface mount
packages.

Hope this helps.

hallo Dave
that's daylight robbery compared to them Ned Kelly was a gentleman
those caps are a simple job not sure of the IC prices check with the group members don't scrap the radio have a go yourself or go to your local club for advice there is always willing help there to show you what to do
the costing of that repair job estimate converted to us dollars equates to $ 433.657 US DOLLARS and in Australian dollars the costing is $ 567 .068 au Australian dollars no wonder most of us fix our own equipment
my advice Dave have a go at it yourself enlist a good mentor from your local club to guide you sorry I cant help toooo far away

Dave

This sounds expensive.

The board is available from the states for about $200, but everywhere
seems out of stock at the moment.

I had two chips go down on my radio.

They were replaced by a local ham for £30 labour. The chips cost about
$36 each from states www.eastcoasttransistor.com.

They are very tricky to replace without the correct know-how and
experience (surface mount with about 100 pins each, so I think this
was a bargain.

East coast were excellent to deal with in the UK, so highly recomended.

If you are near the liverpool area send me e-mail and I will give you
number of ham who replaced mine (if he is happy for me to send it).

regards

Peter

Just a FYI.
I recently had my 850 in the shop for the same problem. After turning the rig on the display would go blank and " UL " would be heard from the spkr. After a couple of minutes, the rig would settle down and thr rx'er would work. Seemed ok for a while untill one day it never came back. The 6db ATT switch did not function either.
About $565.00 later, they replaced:
2 x DDS chips
15 electrolytic caps
1 VCO
1 DC-DC sub assembly
1 lithium battery - for @ 25 fricken dollars!!!!
4 hours labor

Note on the workorder says defective DDS Assembly, leaking caps, out of allignment and bad VCO2.
The rig works FB now but this was the 1st time it's been to the shop since 1992. Upon looking at the capacitors, there was no visual leakage - trouble is internal - can't do this by eye.
To me the rig was worth it BUT it hurt just the same!

Hello, another ham buddy of mine has a rig that I'd like to buy so I'm considering selling my 850. I'd give the cosmetics about an 8 mostly because of wear on the sharp edges of the front panel but the face is excellent and the display is only a couple months old, it was replaced by Luther so there would be no worries about the bad cap ruining anything it's all new. I have the original manual which has had little use because there's also a printed copy along with a printed copy of the service manual that was kept in a 3 ring binder, I have the original up/down mic with little use, Kenwood double boxes and inserts, it has the 1.8SSB filter in the 8.83 IF, the 500Hz CW filter in the other 8.83 IF slot, and the 2.4SSB filter in the 455 IF Slot. It also has the DRU-2 installed which works better than any other rig I've had a digital recorder in. It has had the MARS mod, and also the Noise Blanker mod which makes the NB work tons better. The radio that I'd like to buy from my buddy has a built in power supply, so I'd also like to sell my Samlex 1223 23Amp power supply with the radio but would also sell without. Not sure what to sell this for with all the accessories and new display and power supply, so I'm open to offers. I would take M.O. or Paypal and I do NOT charge the buyer my seller fees.

Hi
Thanks for read this post.
I've a TS850 that is dead in TX, the power output is below 2 watts in all bands and modes, the power supply meter says 5 Ampers at 14 volts in TX for this 2 RF watts. In RX works fine. It happended after electric storm. Another TS850 with the same PSU and Antena works fine.

I'm not sure if there are a fuse inside.
Is posible DC-DC problem, or a end transistor fail?. Any idea for begin the troubleshoting.

Thanks in advance.

Hi Xavier,
what is ALC meter indicating?
If full scale and your power control is fully clockwise turned there is
maybe DC-DC problem.
It is very simple to fix - as I have experince :-(
Good luck!

Paul,

If that is the original battery, it is 14 years old. Might be a good idea to check it. All the batteries are soldered directly to the digital board. It is not difficult at all to replace them. Better off to buy a battery holder and mount it up under the top hatch so it will be easier to get at next time. Old motherboards have battery holders on them.

Paul,

If that is the original battery, it is 14 years old. Might be a good

idea to check it. All the batteries are soldered directly to the

digital board. It is not difficult at all to replace them. Better off

to buy a battery holder and mount it up under the top hatch so it will

be easier to get at next time. Old motherboards have battery holders

on them.

Paul, my TS850 is 14 yrs old as well. Just had Radio World change
mine while doing repairs this past january...25 bucks!!!
The old one still reads 3.3VDC. Your call. Max's idea sounds pretty
good.

What is the s-meter doing, in other words is it an audio problem or worse?

Is it the same in all modes? USB, LSB, CW, AM, FM???

It has most likely been asked and answered before, but I am new to the group. What would be the best choice of LDG auto-tuners for use with the TS-850S. My XYL wants to get me one for X-mas and wants to make the best choice.
Thanks in advance for your comments.

Hi Randy,

Try these simple tests first.

Two or three checks to perform before you are tempted to open the case
are;

1. First audio amp check is easy, if you have the VS-2 voice readout
option fitted then press the button and see if it works, or borrow one
from another Ham.

2. Or check to see if the tx monitor facility is still working which
should confirm the yes/no operation of the audio power amplifier, IC6,
UPC2002V.

The VS-2 and tx monitor outputs go to the same point just ahead of the
audio amp ic.

3. Acc2 socket carries audio out on pin3 wrt pin4 ground. This is
higher up in the audio chain before the mute device, IC5, TA7324P.
Get a 13pin din plug, connect 2 wires to pins 3&4, plug into acc2 skt
and check for signs of audio on a scope.

The audio chain is implemented on the IF Unit x48-3080-00.
You can download the manual from the mods DK website.

I'll watch your thread to see how you get on.

Hope this helps you,
Good luck.

I have not used any of the LDG tuners, but the SGC all work well so I
see no reason why they won't. So to answer your question...what is the
best one to go with...

...the most expensive!

I've run my LDG Z100 with my TS-450Sat and it does better than the
internal Kenwood tuner. If I didn't need it for my TS-50 mobile it
would have a home inside on the TS-450!

Hello,

A friend of mine recently bought a TS850 from a Belgian OM.

As there were some power restriction in Belgium, the 850 shows
only 10 W on 160m !

Does anyone knows how to convert these 10W to the nominal
100 W ? Is it a matter of menus or of the diode matrix behing
the front panel ?

Tnx for your help.

loose pins on mike socket plugs or intermitent fault in the mike lead as it goes into the mike socket test by wigling cord at mike socket and also up by the mike ,,, mike socket try and lever the femail sockets over with a verry thin jewelers screwdriver i have had both of these problems there again might be a dry solder joint on the socket inside the radio ((just a thought))

It's the diode matrix. In the European versions one has D9 and the other D10. Whichever yours has cut it. The modified US version (tx everywhere) has all diodes cut or missing. I'm speaking of D8-D12 only not all the diodes on the board.

There is a small PCB soldered directly to the back of the mike jack.
Over time the solder joints can crack and cause intermittents. Reflow
the connections and all should be good...

Rupert,

There is a menu setting to tell the 850 auto tuner to stop tuning when
a match is reached. Make sure the menu setting is not disabled.

Tim,

Fred, N8BX seems to have lots of 850 parts from time to time. You can get his e-mail off QRZ.com I have bought many parts off him in the past and always had great service.

All the parts in it are the same age, how many you want to replace.
Seriously the only thing that may need attention is the battery to
make sure it's not leaking.

Rule #1: "If it ain't broke don't fix it"

Rupert,

There is a menu setting to tell the 850 auto tuner to stop tuning when a match is reached. Make sure the menu setting is not disabled.

I changed the option in my '450 to 'manual tune' because I have the same problem as not stopping when it gets bottomed out. Only thing is, how do you manually tune the '450 tuner? 73 and thanks

The main VFO knob and MEM. CH. knobs controls the manual tuning.
Also, in auto tune mode, make sure the carrier level is up high
enough. If it is too low the tuner will not stop.

Hello Hervé
Have a look at this German forum,not sure the information is correct
but it will be an information for you:

http://db0sif.darc.de/cgi-bin/dpcmd?R%20KENWOOD%20133

You will find a table about diodes D8 to D12, there is also some
reference to the 10 W limit in Belgium.

I have not modified my TS850 so i cant tell you if it is reliable.

You need to change the memory battery for sure, if you have not done so yet !
My serial starts with 410, considering it is 14 years old ! There are some capacitors that need to be checked.

check here :

Hi Clif

Apparently, not on all '450's. I have had the same problem, no audio, and I checked the mike jack like you suggested. There were some wires coming directly off the mike jack, going to a small board plugged into the main board. Anyway, I re-seated that board and took a small screwdriver and wiggled the wires on the back of the mike jack and it started working again. Thanks for your suggestion, it worked. 73

Press and hold the M.IN button when you turn on the radio. Use the M.CH knob to select menu # 31. Press the UP/DWN switch to set to "OFF" Press the CLR button to exit the menu mode.

The tuner is now adjusted manually with the VFO and MEM.CH knobs. To return to AUTO TUNE mode, repeat the steps and select ON for menu # 31.

Hi all, new to the group, I have a TS450SAT that has a problem. There is no speaker audio on ssb ie no audio through the speaker, although there is signal present on the s-meter. I tried headphones but still nothing. Also tried audio through the acc3 , still nothing. Funny thing is FM and AM are fine, its ssb and cw has the problem. Also tx is fine on all modes including ssb. I done the usual reset of the rig ,but nothing
I just purchased the rig and it has been working fine for a week. I feel this rig has been sitting unused for a while, because when I first turned it on a few of the knobs were very stiff and very crackly. I turned it off , and back on the next day...nothing.......HELP
ie And yes I checked the squelch

Hi Rob,

I have built 3 or 4 of those using the exact schematic. Every one
worked just fine with my 850.

It sounds like IC2 on the Car unit has gone off freq. Do you have a scope to look for signals? This is one of the DDS units (YM6631) that has been known to fail.

Hi, againI had another go with my rig last night and I can get very low speaker audio if I carefully adjust the IF SHIFT control. There are a couple of spots where I can make out the audio, but not 100% clear.

"check the rf gain control to be fully clockwise, not counterclockwise......where is your s meter readings, do the headphone jacks work?????"

Yes I checked rf gain, if rf gain was up then AM AND FM would have the same problem
S-Meter readings are normal, received signals are the same on another rig.
Headphones are the same as external speaker, no audio

No I dont have a scope , in fact I dont have any test gear, only a multimeter. Just fishing for possible causes to the problem, maybe someone else has experienced the same.
Thanks Cliff

In 850, no big deal - have to get to the board, cut 2 jumpers, wire in the SO-2.
So easy even I was able to do it. Hardest part not dropping the screws into the innards.
See page 68 of 850 Op Manual or email me if you don't have it.

5328. TS-850 internal receiver noise -- thoughts?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-12-09 23:16:15 UTC
From: Brian Mileshosky
Topic: 5292 Message: 5328

All --

An interesting question for you TS-850SAT owners.

While running Phone Sweepstakes last November I was using my 850 a whole bunch, where in the past I'd only use it for casual operating or checking into nets. During the evenings when I migrated down to 40 and 80 meters I noticed that some strong noise would saturate my receiver somewhat intermittently. Tuning to another frequency wouldn't help escape from it, nor would the nature of the noise or the signal strength (S9+) change. I decided to troubleshoot by disconnecting the antenna, and discovered that the noise was still present, and just as strong. The source was inside my TS-850! I noticed that it got weaker and eventually disappeared as I changed to higher and higher bands (freqs).

From minor experimentation, it only appeared as I drove the radio somewhat hard like one would in a contesting environment. Not that I've confirmed that this is a cause, but I noticed this would happen mainly when utilizing the voice memory keyer a bunch to call CQ. Perhaps only a coincidence, but still a data point.

I need to get it back on the air and do some more experimenting to see if I can locate what contributes to this issue. In the meantime, has anyone discovered this problem before? Thoughts?

73,
Brian, N5ZGT

I bought some RV & Motor Home Paint at our local Canadian Tire store.
Color was "GUNMETAL" I painted all the cabinets in my TS830 line and
it matches very clsely the colors of the 850.

5331. Re: [TS-850_450_690] TS-850 internal receiver noise -- thoughts?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-12-10 06:26:23 UTC
From: Paul
Topic: 5292 Message: 5331

I used to get similar noise, but not from the source you mentioned. It was local qrn from various sources. I am using the old PS52 PSU, which has no mains input filter. I fitted a ferrite ring filter, with some 30 turns at each side, salvaged from an old tv set, and the qrn cleared. The ferrite enclosures between the psu and the rig are simply not enough.

Whilst on the same theme of noise, I feel that the carrier insertion for SSB in the ts850 is somehow noiser than other rigs

Paul

Brian Mileshosky <n5zgt@...> wrote:
All --

An interesting question for you TS-850SAT owners.

While running Phone Sweepstakes last November I was using my 850 a whole bunch, where in the past I'd only use it for casual operating or checking into nets. During the evenings when I migrated down to 40 and 80 meters I noticed that some strong noise would saturate my receiver somewhat intermittently. Tuning to another frequency wouldn't help escape from it, nor would the nature of the noise or the signal strength (S9+) change. I decided to troubleshoot by disconnecting the antenna, and discovered that the noise was still present, and just as strong. The source was inside my TS-850! I noticed that it got weaker and eventually disappeared as I changed to higher and higher bands (freqs).

From minor experimentation, it only appeared as I drove the radio somewhat hard like one would in a contesting environment. Not that I've confirmed that this is a cause, but I noticed this would happen mainly when utilizing the voice memory keyer a bunch to call CQ. Perhaps only a coincidence, but still a data point.

I need to get it back on the air and do some more experimenting to see if I can locate what contributes to this issue. In the meantime, has anyone discovered this problem before? Thoughts?

5334. DDS Chips

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-12-11 13:14:26 UTC
From: Steve McGregor
Topic: 5334 Message: 5334

Can somebody tell me whether these are still available? I have a TS850 and all the DDS chips except one (IC3) have been replaced. I have no CW sidetone and the SSB through the monitor is very distorted.
Are East Coast Components OK and are they happy to send to the UK, or is there anywhere in the UK that I can get them from.

Thanks

Steve M0SMC

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-12-11 15:48:25 UTC
From: John Kuklewicz N7ZN
Topic: 5332 Message: 5336

Remove top cover of transceiver.

Remove metal bracket where DRU-s and VS unit would mount.
This is also the bracket with the DIP switches used to setup
the filter configuration.

Remove metal plate under the above bracket.

The CAR unit is now exposed. Easy to remove - some coax cables
and a few headers. The four DDS chips are quite distinctive -
square high pin count surface mount packages.

Hi all
I wrote in mmy post, I want to exchange this manual with 950 SDX SM.
Now I got one 950 SDX SM and did the same scanning, also very high and
colored resolution.
Also very large.
Now I am looking for TS-870S service manual in the same quality for
exchange to this two manual.

Steve

I recently ordered two DDS chips from East Coast Components for $28 each.

Service was faultless, but postage was a little high at about $15 ,
especialy if you order just one chip.

But as the exchange rate is so good now this is not realy a problem.

I e-mailed them first, then telephoned with credit card details

I am in the UK

Regards

Clint,

The file size would make it almost impossible to be uploaded here.
They are in the 40 megabyte range. It would need to be uploaded to an
FTP server and downloaded from there.

5347. PS-52 Question

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-12-17 15:00:40 UTC
From: Ron
Topic: 5347 Message: 5347

Apologize in advance if off-topic but couldn't find Yahoo group that seems to adress this unit.

I operate my TS-850SAT with a PS-52 power supply. It has suddenly started supplying 24.8 volts dc rather than the normal 13.8. Amazingly the 850 still runs, just problems on transmit. Popped cover and it appears that diode D4 has blown. Downloaded the PS-52/PS-31 manual from mods.dk but can't read the part number. Does anyone on the list know what part diode D4 is?

Thanks

Ron - AG1P

I have for Sale my One Owner Top-performing Kenwood dream contest station consisting of (1) TS-850S/AT Transceiver, with automatic antenna tuner,(1) SP-31 External Speaker (3 audio filters) built in,(1) PS-52 Power Supply and to top it off a SM-220 Station Monitor with the BS-8 panoramic adapter, for the serious "contester included is a TimeWave DSP-59 filter for the "serious" contest situations in case the internal filters miss something.
Transceiver is a 30 million serial number, has the following options VS-2 Voice Synthesizer board, DRU-2 DIGITAL RECORDING UNIT (factory Installed). Filters installed are SSB YK-88SN-1, CW YK-88C1 and an YK-455C-1 "Collins" Mechanical for that CW edge. MC-43S hand microphone. D11 is not in place so 60 meters is just fine.
Transceiver, Speaker and Power Supply are as new condition, user manuals as well as the TS-850 factory Service manual, PSW and Speaker, SM-220, all original boxes As well as original external shipping box for everything except the SM-220. Non-smoker household .Works Fantastic.
I prefer to sell the whole station together as I do not believe in "parting" out a work of art, and playing the ebay game.
If you are serious, contact me on my yahoo email and we can talk!
Pictures are available.
Best regards
Steve

5358. ts850 switch settings

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-12-20 00:00:22 UTC
From: ve3wej gmail
Topic: 5358 Message: 5358

I have installed the sn-1 filter now, and am still confused about the dip switch under the lid...

the book says sw 1 on for the 455 filter, ok...got it
the book says sw3 or 4 for the c-1 or cn-1 8.83 filter (respectively) ok got sw3 on...c-1 filter in my machine

what about sw 2...i have the sn-1 installed but does that switch control whether you have th s-1 or sn-1....nothing I found yet in the manual tells me where to set that one

From: Mark Saunders, KJ7BS
Topic: 5363 Message: 5364

Ham Radio Deluxe is definately the way to go for a station log with rig control. it is feature rich and best of all, it's free. The support on the software is excellent. I've been using HRD for the last two years for my main logging and rig control software. I have it loaded on my main computer in the shack for fixed operations with my TS-850S/AT, IC-706MKIIG, and Elecraft K2. I have HRD loaded on my laptop for field use with the K2. I use a MicroHam USB interface to the rigs except for the K2 which uses special wired DB9 connectors..

Hi Dave
switch on the microswitches and you will hear and see hoe the filter
will work.
Also it is possible to use filter for tx, see the manual.

Additional I want to say, I used HRD for long time, but the autoswitch
to LSB below 10 MhZ is not implemented yet, I wrote the autor and
became a strange answer, so I use VQLOG as main program, if I want to
make digital modes, I use MIXWIN and after the qsos I export the
internal log of MIXWIN to VQLOG.

I sent a email to BUXCOMMM and told them what I was
looking for, and I got an email back telling me the
part number and price. But all din plugs and not din
plugs, there are differnt sizes and pin location, even
its a 6 pin the plug that goes in the ACC1 on the
TS450s the pins are closer togeather then most din
plugs. Ok oh well my plug will be here in a few days.
Tnx for all the input.

The version I put in the Files section is 5.2. It lists the program as
shareware by Brian Gilhuly, VE3BGB.

His address as of 1995 was:

Brian Gilhuly
76 McDonald Street S.
Arnprior, ON
K7S 2W5
Canada

This address still appears to be good.

His e-mail address listed was: brian@.... That address is no
longer valid - I just sent an e-mail to it and it bounced.

In fact, I looked around and it appears synapse.net doesn't exist anymore.
Maybe I'm one of a rare breed - I still have the same e-mail address I
had in 1995!

Maybe someone could write to him and ask if he still registers the
program (or am I elected?) :-)

plugs, there are differnt sizes and pin location, even
its a 6 pin the plug that goes in the ACC1 on the
TS450s the pins are closer togeather then most din
plugs. Ok oh well my plug will be here in a few days.
Tnx for all the input.

Does anyone know where kentrol comes from? Is there a site that I can go to to find out about it? If I were to want to get the full operating version? I have searched the internet but have not come up with anything usefull except older versions than listed here.

Zack
Thanks I just mailed him a letter to see what happens. Looks like he had up to ver.8 something. No need of you having to do all the work, seeing as I'm the one who needs the info.

Yes I'm using it with the TS-850SAT. I'm using WIN-EQF for logging, I've been real happy with it for logging since 97 in differing forms and versions. And it reads the 850 info into it just fine, but doesn't control the radio. So I'm not too interested in a new logging program, just a good radio interface.

According to the directions, Kentrol (at least the version 5.2) works with the 440, 850, 940, 950, R-5000, the 140/680/450/690 "for HF operation", and the TS-50 except there is evidently no remote control feature for reading or writing to the memories on the TS-50.

I happen to like the feature that you can save the memories as a computer file and upload a whole new set all at once to the radio (except for the TS-50). I have several sets of memory files for "beacons", "SW broadcasters", "UTE stations", etc.

Clif, I know you are the Kenwood guru. How do you compare the 850 vs. the 870? I have both. To me, the 870's receiver seems a little quieter. I also have the 450 and the 690. I find the latter are great boxes for the money, especially with all the filters in them. I just hope none of mine quit.

Happy holidays everyone!

5392. Filter setup question for the TS-850s

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-12-24 19:43:48 UTC
From: Tim Logan
Topic: 2705 Message: 5392

Hi folks -
I have just purchased a TS-850s off of ebay with two Inrad 500hz filters. I have purchased it for cw use but have not been up close to a TS-850s. Can someone clairfy for me the filter slot layout and model numbers of the original Kenwood filters available for each slot? I figure I'll shop for filters while waiting for rig to get here.

Here are my other questions (bear in mind that I am just a guy who loves cw but a techno moron.):
1 - To this point I am only familiar with Ten Tec for cw operation - Ten Tec uses the term "cascade" for their filter setup - so I will borrow that term here.
2 - I presume the two 500hz Inrads it comes with are in line, what I call cascaded, can I leave them in and also have the option of cascading a 500 with a 270?
3 - Those of you who use a 270 - does it "ring" - any comments on that filter width would be helpful.
4 - If I want to put in a 1.8 filter for occassional SSB, will it reduce my options for cw filter combinations?
5 - Were the original Kenwood filters pretty good or should I shop for Inrad when looking for a 270 and 1.8?

Thank you in advance for your help and may all have a healthy and happy coming year.
73/Tim NZ7C

Tim,
The '850 has 'slots' for three filters, two in one IF stage, one in the other (can't remember which is which). One filter in each IF stage can be cascaded with one filter in the other IF stage. SSB or CW, either way.
If you have the INRAD filters, stick with what you have! The Kenwood filters are 'poo-poo' compared to the INRADs. Cascading two 500 Hz filters gives you the equivalent of about the 25o Hz.
If you want a narrow SSB filter try the INRAD '2.1'Kz filter, you'll like it much better than the Kenwood '1.8' filter, believe me!
Paul / W5LZ

5394. Thanks Paul - Filter setup question for the TS-850s

Paul -
Thanks Paul - I assumed the Inrads would be much better, but on my TS-480 Kenwood surprised me - IRC said they could not make better filters for it than the Kenwoods! In any event it sounds like the existing pair of 500Hz filters gives me just the result I want. Thanks Paul! Your help is most appreciated..

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-12-25 00:33:35 UTC
From: crownhaven
Topic: 2705 Message: 5395

Tim, congrats on your purchase. I believe you will like the TS-850S. I have one as well as a 690, 450 and 870. They are great CW boxes in my opinion. The 450/690 and 850 allow you to select filters separately and independently in each IF. You have a button for each IF that allows you to select a filters independently of the other IF's. In my 850, I have a YK-88C-1 (500) and a YK-88CN-1 (270) as well as a YG-455C-1 (500). This fills up the three slots and corresponds with the display. HOWEVER, you can put an SSB filter in one of these slots instead of the CW filter but the display won't be correct. It doesn't matter. In my 450 I have a 500 Hz filter, 250 Hz filter and a 1.8 Hz SSB filter. In the 690, I have two 500 Hz filters as well as a 1.8 Hz SSB filter.

I got the SSB filters in various trades, etc. They are OK but you don't really need them. One thing to remember about the 850 is the slope tuning. You could actually get along without filters if you wanted and you can use the slope tuning in any mode to tweak your bandwidth. It only worked in the SSB mode in the TS-940.

There are those who know better than I what combinations of filters work best. I have never tried the IRC filters in any of my Kenwoods but I would like to. However, the expense has kept me from doing it with the filters I have already.

I would love to hear some comparisons from TS-850S owners of Kenwood filters vs. the IRC filters. I bought IRC filters once for a Yaesu radio and I didn't like them. However, it was the old 747 which wasn't much of a radio to begin with.

The TS-850S followed my TS-830S which had an incredibly quiet receiver. I bought the 850 because the controls, layout were similar to the 830. The 940 was not. Further, the QST review at the time said it was the best receiver they had tested as well as the best CW box. They weren't wrong in my opinion.

My only fear is mine is going to break and I won't be able to get it fixed. All of this being said, try an 870 too. I think the receiver is a little quieter than the 850 but I wish it had options for hardware filters.

I have had to send my TS-850S back for service about three times since I bought it new at HRO in VA many years ago. Minor stuff and no big deal in my opinion. My SN is 30100836. If I could find a very late 850 in perfect condition, I would buy it for a spare here.

Happy holidays.

5396. RE: [TS-850_450_690] Filter setup question for the TS-850s

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-12-25 06:22:53 UTC
From: Steve Gehring
Topic: 2705 Message: 5396

Hi Tim,

I agree with W5LZ's comments. The matched pair of 400 Hz CW filters from IRC is your ticket to success. Cascaded, they are an incredible combination.

As for the lone 2.1 KHz SSB filter in the 8.83 MHz IF, assign it to the 270 Hz slot, dipswitch #4 on. In effect, this will leave the rig☐s installed 2.7 KHz filter alone, offering you the choice between these two SSB filters by the push of the 8.83 FILTER selection button on the front panel. You'll like the difference the 2.1 KHz makes for you on crowded bands -- slightly narrower, but with steep skirts. Like you may assume, install and assign the Inrad 400 Hz CW filters to the 500 Hz slot in both IFs. ☐ dipswitch positions 1 and 3 on.

These Inrad filters are the bomb! Enjoy on of the better analog radios ever built. They really are exceptional.

73 and Merry Christmas.

Steve, NL7W

"You see, wire telegraph is a kind of a very, very long cat. You pull his tail in New York and his head is meowing in Los Angeles. Do you understand this? And radio operates exactly the same way: you send signals here, they receive them there. The only difference is that there is no cat.☐

From: Ed Weston
Topic: 5398 Message: 5398

Does anyone have a source for paint to match the 450 or 850 case.
I have a couple of spots to touch up and would like to find a good
match for them.

73
thanks Ed AI4KE

I gotta say, I have been a Kenwood fan all of my Amateur radio career, (TS-440, 850, 870, 2000, and Yaesu ft-100d) and the 850 drives me nuts listening to it for more than 1/2 hour; a constant hiss. The 200 was equal of worse. The only reason I have kept the DSP-100 is for the quietness it brings to the 850 receive. I agree the 870 is a tad quieter, but not much. I hate to say it, but I want to check out an Icom pro 3 as I read the owners say it has a very low noise floor. AES, in Milwaukee said I could bring my own 870 in and set it up next to a pro 3 for comparison and I will do that some day when I have time. If it plays well, you never know!?

There are rumors that Kenwood is going to bring out a new HF rig in 2007. Anybody else hear such?

Happy Holidays.

It would be real nice if they brought out a SDX-970... but I doubt it.
Kenwood seems to have abandoned the high end HF radio market.

Paul - K2BK

P.S... I have an Icom 756-Pro-III, and it's a great radio.

JUst plug-in? No, not the 455 stage filters, they
are slightly larger than Kenwood's. It really isn't
that much of a problems though. It means the
bendingpove, or removal of the two inner pins on each
'end' of the filter. Since those two pins don't do
anything anywaym it isn't a 'biggy'. (they just 'hold'
the filters, sort of, by going through the pin-sockets
on the filter board.) The two 'outer' pins in each
socket are the only ones which need/should make
contact with anything. 'Wire-wrapping' the leads from
the INRAD filters works just fine (or solder them,
whatever).

Topic: 5406 Message: 5406

Hello folks....I have a Rascal interface that I have been using with Digipan and my TS-870S. It worked great. I just swapped out the 870 for my 850 here in the shack and plugged the interface into the 850. According to everything I am reading, all the wiring is the same, etc. However, I get only a hum when I key the TS-850S. The transmitter does go into transmit but no tones. I have an FSK and AFSK cable with the Rascal and the same thing happens with either cable. FSK via MMTTY works fine as it did with the TS-870. I can't figure this one out. Any thoughts??????

Steve, N4JQQ

From: n7ioh
Topic: 5409 Message: 5409

Hi all, I know we have discussed how to determine when a radio was built by the serial number. However, I am thinking that the formula of subtracting two from the first digit to determine the year might be wrong. I am a member of another Yahoo group for the Kenwood R-5000 receiver. We have been discussing this for a few days and the subtracting of two does not seem to be working too well. What a few of us have come up with is subtracting one from the first digit for the year seems to be more in line with what you would expect for a delay from manufacture date to being received in the retail stores.

Here is what I have found out about my R-5000. The radio was made from 1987 to 1996 according to DXing.com. Here is their link, http://www.dxing.com/rx/r5000.htm My serial number is, 8040137 which would make it made in April of 1986 if you subtract 2 from the first digit. I have the original boxes and on two sides of the large box it is dated 8-13-87 as the shipping date from Kenwood in Long Beach, CA to HRO in Burlingame, CA. I can't imagine Kenwood warehousing a radio for one year four months before shipping it to a dealer. Four months does seem more in line with what I would expect figuring shipping from Japan.

I would be interested in hearing from others that may have some documentation that would shed more light on this subject.

Ric,
That's one of 'those' questions. Depending on how familiar you are with the '850, even a 'high' price might seem reasonable. The average (from both the highest and lowest figures I've seen lately) is something around $800 dollars. It's a very wide range of prices so give or take something around 40%, sort of. That 'average' includes both ends of the spectrum, junk to a literally new radio, and isn't gonna be of much help to you. I can tell you what I paid for an '850, but then you gotta figure in just how 'crazy' I qam to start with, you know? What was the asking price?

my self, I would not by the ps-53 not the matching power supply for the 850, but you could figure around 800.00 for radio, 100 for powers upply, and 100.00 for mike..

some prices higher , some lower, best to search the swap listings online and see what they selling for

I've seen them go for $650 to $1000 (just the 850). I paid $900 for just my 850, which was in mint condition. It had the ATU and DRU units installed.

I've been using my PS-50 with it, which doesn't match the 850 cosmetically but works FB. I bought it from AES for I think $150 to use with my 440 (now a standby rig).

Having Inrad filters in the 850 probably makes it more valuable. If there's any improvement I'd make to mine now, it would be to add those.

I was thinking about sellin mine... I Love this rig... , But i did
not know where to start for an asking price....
Now i know. So I guess i will either put it on ebay.. For list it on
qth or somewhere ....
ANY OFFERS...
Would trade whole setup for Something different.. Would like to try
something different

Topic: 5408 Message: 5416

I have a Kenwood TS-850SAT has Autotuner built in.,in great condition say 8 of 10, a few small marks, Comes with Kenwood PS-53 Power supply in like condition as well, And Kenwood MC-60A Desk Mic. Looking to trade to try something Different,Rigs Of Interest Icom Ic-706mk2g, Ft-100d, Ft-857d,TS-570d,ETC. I will take trade offers for a few days, if no bites off to Ebay it will go, Cash offers will be Considered as well, PACKAGE DEAL, SSB FILTER IS INSTALLED
PayPal Accepted

5417. ts 450s problems

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2006-12-31 23:41:39 UTC
From: senat0r215i
Topic: 5417 Message: 5417

Hi
I just got myself a ts450s and when I first got it it worked fine.
After I handed the cash over I plugged her in and to my suprise the rf
gain was full 60db and I could not hear anything. I thought the rf gain
knob was faulty but after pulling it apart and unpluging and pluging it
back in it got better. The only thing I could do was play with vr1,vr10
to get it working. Once that was done I thought great, I can hear so I
started txing on 10 meters and after about a hour the rig dropped to 10watts and rx went
weak. ?? So after playing and pulling things apart and it would work then would do the same
thing. I checked my power plug and black and white were loose so I have put a new power
plug on and it seems fine.
I'm sure the old owner was a big morse person because this radio did not
come with a mic (only morse key)so that had me thinking and also my usb
and lsb there is not much difference ?

Hi all, I am a little surprised that no one has any comment or evidence ether way to help in determining when our radios were actually built. I was kind of hoping others might also have their original boxes and may also have shipping dates on them to help determine age. I remember in the earlier discussions about the serial number and radios age there were a few that did not seem to be too sure the formula was correct. I don't have my TS-690 with its boxes any more so I can't check them and my TS-850 did not come with the boxes. Is there anyone out there who can provide some more input into this?

What difference does it make?? A semi accurate indication is the date code on the IC's. It can't be earlier than that but is probably not too much later as they are believers in JIT.

hallo cliff
it doesn't matter at all to some of us some people like to do research its like another form of hobby i myself do know the data on mine we all like to know when our radios had been released and with certain serial nos. we can pinpoint problems with certain serial nos. and if there was a data system in the archives that would be of help to the people who do not have this information i am just pleased that some one is taking the time to collect this information personally i couldn't be bothered to do that there again if something i wanted to know i would be the first into the group looking for that information

5422. Date of Manufacture

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-01-01 21:15:42 UTC
From: Ronald Starr
Topic: 4894 Message: 5422

I'll add a bit of information to this interesting question. I purchased my TS-850SAT from the original owner in November this year complete with the original shipping cartons. The S/N is 60200177 with the original Kenwood carton identified with the correct S/N clearly stamped with the logo "Kenwood Shipping 05/09/95." Additional logos indicate it was purchased new from HRO in Portland, Ore. tho I do not have the original sales receipts to clearly establish date of sale.

A TS-940SAT was purchased new from Texas Towers at Hamcomm 1985 on 06/01/85 with a S/N of 5110558. I recall mention from the salesperson that this was a very popular item and difficult to keep in stock but additional stock had been ordered in anticipation of a good turnout at Hamcomm. I had attempted earlier puchase via mail order from two different vendors but was told the 940 was currently out of stock so chose to pay Texas sales tax to get one at the show. The original shipping cartons are at another location so I cannot check for addtional data at this time.

Certainly, Kenwood should be the final authority on this if they will just share the information.

A very Happy New Year to one and all! Ron K0OXB

5424. TS-850s AGC distortion

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-01-02 17:57:36 UTC
From: marcogoni
Topic: 5424 Message: 5424

Hi all,
I have an excellent TS850 that works perfectly except that sometimes it produces distortion on SSB audio at signal peaks. This is especially apparent when FAST and MID AGC positions are used. The problem disappears setting the RFGAIN low enough.
As far as I understand, the problem is due to slow AGC attack time and changing the R/C time constant solves the problem.

I found this problem to be common with the 930 and the 440 but I cannot find the mod for the 850.

I wonder if any of you has observed (and solved) this problem...

Thanks a lot!
marco

Marco,

Does it do this with the noise blanker "off"?

Yes Max,
it does it without engaging the NB.
The kind of distortion you get from the NB is very similar though.
The problem vanishes if I reduce the injection signal in the RF board
through VR17. But this is only true if the signal does not go over S9.

I remember that in the original QST review they observed a similar
problem.

Kenwood ASB-1049 addresses a click noise with over S-9 signals when
the Notch is on. It shows the parts to change to slow down the AGC to
correct this. Might be worth looking at. At least it show the AGC
timing parts...

5432. RE: [TS-850_450_690] ts 450s problems

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-01-05 07:36:44 UTC
From: JamesMNelson
Topic: 5417 Message: 5432

Take a look at the jumper that runs from the filter board to the chassis mounted SO-238. What I have found on BOTH of my 690's is that after moving them around over the years that SOLID wire jumper develops a cold solder joint. Both of mine have been on the filter board end. I took my filter boards out and replaced the jumper with a stranded wire jumper. If you replace the jumper with a stranded one, be careful not to get to much solder on the wire as it will flow up the strands and then you might as well be back with a solid piece of wire. I have also seen this on a few 450's that I have fixed for friends. One why that you can tell is to wiggle the connector while receiving or watch the SWR while transmitting. I just would not transmit long. Most of the time it shows up when you pull back (out) on the connecter or push in.

Hope this helps.

Subject: [TS-850_450_690] ts 450s problems

Hi
I just got myself a ts450s and when I first got it it worked fine.
After I handed the cash over I plugged her in and to my suprise the rf gain was full 60db and I could not hear anything. I thought the rf gain knob was faulty but after pulling it apart and unpluging and pluging it back in it got better. The only thing I could do was play with vr1,vr10 to get it working. Once that was done I thought great, I can hear so I started txing on 10 meters and after about a hour the rig dropped to 10watts and rx went weak. ?? So after playing and pulling things apart and it would work then would do the same thing. I checked my power plug and black and white were loose so I have put a new power plug on and it seems fine.
I'm sure the old owner was a big morse person because this radio did not come with a mic (only morse key)so that had me thinking and also my usb and lsb there is not much difference ?

5434. Spare parts "drawer" for TS-850S

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-01-08 04:09:12 UTC
From: nz7c
Topic: 5434 Message: 5434

I recently acquired a TS-850S with a later serial number and the 66312 DDS chips. It is the first TS-850 I have owned and I am very, very pleased with it. I also acquired a spare CAR board, knowing that the parts suppliers I am aware of (Kenwood East, Pacific, and Partstore) no longer carry them. My question is this - other than the CAR board and assuming casual cw use - what other spare parts, if any, might it be advisable to pick up to keep these wonderful rigs going? Are there any other "vulnerable" areas of the radio (excluding the battery change out)? Thanks in advance and may all have a safe and healthy year 2007. 73/Tim NZ7C

As far as I know there are no dealers in St Louis although there are couple of electronic supply houses. I am about equal distance from St Louis and Kansas City, but go to Associated Radio in Kansas City Area for gear as they are only one listed in my area. As far a New York City, Kenwood and Icom show one dealer -
Barry Electronics
99 Second Avenue
Between 5th & 6th
New York, NY 10003

Gateway Electronics in St. Louis has some ham equipment and TONS of parts!
I always go there with a full wallet and leave with an empty one. :-)

Here is their webpage:

http://www.gatewayelex.com/

Their store used to be very easy to get to, on Page Ave., but they moved
to a more hidden place. Click on the map link on the webpage to see the
location.

Control.

I did take a look at the other interesting stuff mentioned, but I really want is to be able to control/query the rig from my log program (VQLog).

I will most likely build a level shifter and use an USB <> serial converter, but skipping the level shifter entirely, would be nice - from an aestetic point of view ;o)

Nan,
Start at the antenna connector and check continuity
with 'center pin'. You will probably find the
'problem' within 2 inches of the connector. (Sounds
like a 'smart' answer, but there is a reason. If my
memory wasn't so bad, and I still had the schematic,
I'd tell you the name of the part, sorry.)

If the center pin was bad I would think the TX would be shaky too.
First thing I would check is the TX/RX relay. Tap it while listen to
the radio. See if the receive cuts in and out.

Hej havde ikke set det var en dansker der spurgte.

Kig f. eks. på WIMO.DE de har forskellige løsninger men ellers har
T.Hansen en USb / RS232 konverter til ca. 125 DKK den har jeg brugt
uden problemer på min TS870S.
Der er en lille CD med til at kreere forskellige COM porte med husk at
den skal være min COM 5 da de interne altid er reseveret (hardware)
til og med COM 4

Hvis du har andre spørgsmål mail via OZ4VW add QRZ.dk

Hi Doc
Just went through that with my number 2 TS-450SAT. Receive wasn't dead, but signals were about 20DB down from number 1 '450. I sent it to a friend of mine to check, and when he got it there, it was working fine. I think UPS must have fixed it when they slammed it against the wall or something :-) Anyway, when I got it back, it was working fine.

On radio 1 I had that problem once and I took the board out that is connected to the center pin of the coax connector and re-soldered it and the ground lead on the jack. Seemed to help. Sometimes the RF will get through the jack where the RX signals won't. 73

Thank you all for your valuable posts. I tried the crude way of signal tracing using my multimeter probe to touch at each stage and I could hear an amplified hiss noise until the input of first mixer - L51 - which is a variable inductor. (on RF board) I could not find any point from this stage towards the antenna input that amplifed the noise level when touched with my probe. I also powered up my MFJ antena analyzer to output a signal at 14.200 MHz. The rig could pick up this signal if the antenna analyser was brought close to the rig. (near antena jack) I am guessing some stage is not amplifying sufficiently. Any tips to troubleshoot further or would this be something too hard without a signal generator & spectrum analyzer? I have confirmed input relay to be okay.

Hello, TS-850.

Hello dear friends!
Can anybody knows about this filter - YK-455C-1?
For what Kenwood equipment can be used this one...
Thanks for the cooperation .... 73!

Best regards,
Vlad Sidorov, RV1CC
http://www.qsl.net/rv1cc

This filter is for the TS-850S,Ts940S and TS-950 radios. Maybe the 450
also

Thanks dear friends for the information... !!!

> TS140, TS450/690, TS850, TS930, TS940, TS950

... I have already checked MANUALS for TS450/690, TS850 and TS940...
but nowhere did find information about YK-455C-1 ... YG-455C-1 only
... What is difference between YK and YG in this case... Can anybody
helps?

From: crownhaven
Topic: 5458 Message: 5458

Anyone interested in a very nice TS-450S/AT, SN 30701105, with YK-88C-1 (500 Hz), YK-88SN-1 (1.8 SSB), TG-455CN-1 (250 Hz), box, microphone, manual. $700.00 plus shipping. I have numerous other filters if you don't like what is in the radio right now.

If you subscribe to this list, you know most of what there is to know about this radio. I really enjoy it. It is a great CW box in my opinion. I use it along with my 850 and 870. It would work as my primary radio if necessary.

There isn't a mark, scratch or blemish on the entire rig that I can see. If you are seriously interested, I can probably get a picture for you. I am a non-smoker. I take care of my gear.

Regards,

Steve, N4JQQ

The TS140/680 has only one filter slot and it's a plug-in in the 455
IF. I don't know what 140's you are thinking of, maybe 120/130/series?
They are solder-in.

5461. Re: TS-450S Dead Receiver

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-01-13 01:56:11 UTC
From: nan_9v1ac
Topic: 5444 Message: 5461

Need some expert guidance please. I suspect RF board Mixer-1 to be the problem stage. Following are the voltages on the FET's, Q14,Q15,Q16 & Q17. The gate voltages are supposed to be "0V" but I read about 0.6v on the gates of Q15 & Q16. Measurements taken with rig on Rx mode, 14.200 & USB using Fluke77 DMM. Filter board disconnected.

Q14 =>> G=0V S=1.45V & D=11.29V
Q15 =>> G=0.57V S=1.9V & D=11.27V
Q16 =>> G=0.59V S=1.44V & D=11.27V
Q17 =>> G=0V S=1.91V & D=11.27V

Also ruinning a cold check on resistance values, I note as follows
R across R48 = 17 Ohms (390 Ohm resistor)
R across R49 = 21 Ohms (390 Ohm resistor_
R between ground and one arm of VR1 = 17 Ohms
R between ground and other arm of VR1 = 21 Ohms
R across L56 = 0.5 ohms
R across Q14 G & S = 27 Ohms
R across Q15 G & S = 19.5 Ohms
R across Q16 G & S = 12.4 Ohms
R across Q17 G & S = 31.5 Ohms

Can I confirm its faulty FETs or is it something else? The FET's are SMD devices and I am afraid if I attempt to remove I could damage them as they are glued to PCB.

Thanks in advance for any help offered!

If the mixers are out the RX will be down abt 20db. Not deaf.

Starting at the antenna with a probe coming off of the MFJ. Touch it
to the antenna connection and take a reading. Then move to the input
of the RF unit, should be the same, appx.

If Ok then; Check Q5, the Collector should be 12v and the base 0v. If
the collector isn't 12v it's shorted and killing the RX. Going on down
the line. Check the outputs on IC2. Pins 1-7 & 9-10. Only one should
be low at a time, the rest should be 7v. If not the IC is bad OR there
are leaky BPF diodes. Check D3 cathode for ~7.5v. If higher check D1-D2.

Touch the probe wire from the MFJ to D3 cathode. Should be same as
other readings.

Go to D27-D28 cathode junction and touch the probe.

If all that checks out then I would think about the mixers. But they
won't work without the VCO feeding in the right level and on frequency.

Thanks Clif. Yes you are right in that the receiver is not 'dead' but rather very weak. If I turn on my MFJ antena analyzer @ 14.200MHz and bring the signal close to the antenna input of the rig, I can receive the signal. The antenna analyzer supposedly outputs a very stong signal (20mv) so I did not conect it direct to antena input of the rig.

I have confirmed Q5 voltage is correct. IC2 voltages, Pin #1 reads 3.9V and #9 reads 0.32V. All other pins read 7V. Are these correct voltage readings?

Nan

Nope, D7 or D17 is leaky, most likely D7. Remove it and see what
happens to the Receiver. Should go way up in sensitivity. Replacing it
is an option as it's the 0-500KHz filter. If you're not a lofer it
probably won't matter.

Thanks a million Clif!! I had to pull out D7 & then D17. It was a faulty D17. Now IC2 pin #1 reads 7V and RX is back to life! I will do some on air tests to confirm.

Is there an equivalent to this PIN diode RLS135? As you have pointed out , D7/D17 only affects 0-500KHz, so its not so critical. However I would like to do a complete job if possible.

Hi Clif, one more clarification please. I still read wrong voltages at the gates of 1st Mixer FET's. Q15 G=0.6V & Q16 G=0.6V. Does this mean the FET's are also possibly damaged?

Nan

5468. Re: TS-450S Dead Receiver

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-01-14 19:26:03 UTC
From: Clif
Topic: 5444 Message: 5468

On the RLS135, I don't know about a sub.

On the mixers look at the schematic. The voltages balance across the mixer. Not all the time are the voltages on a schematic correct.

Clif

I am using two usb to rs232 interfaces between a laptop and ts850. Buxcomm sells them as well as an adapter that goes between the acc port and rs232 connector. The usb/rs232 at the local pc store are probably fine.

Hej havde ikke set det var en dansker der spurgte.

Kig f. eks. på WIMO.DE de har forskellige løsninger men ellers har
T.Hansen en USb / RS232 konverter til ca. 125 DKK den har jeg brugt
uden problemer på min TS870S.
Der er en lille CD med til at kreere forskellige COM porte med husk at
den skal være min COM 5 da de interne altid er reseveret (hardware)
til og med COM 4

Hvis du har andre spørgsmål mail via OZ4VW add QRZ.dk

Thanks guys
I soldered pins on small pcb board.Pins have not good contact.Many times plug and unplug connector with small pressure damage pins contact.Maybe,I fixed it.

5471. TS-850 with a dead reciever

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-01-15 22:46:47 UTC

Topic: 5471 Message: 5471

Hi all, happy new year.

Somethings happened to the receiver in my TS-850. I had the day off today and figured I'd play radio a bit. I turned it on this morning and it was fine, on 80 meters from the night before. I switch bands up to 20 meters, and then switched over to my long wire using the switch on my tuner, and out went the receive.

I've tried all the modes/bands and I've got nothing, no signals and no audio. It seems to TX just fine though. I do get RX audio on FM, but still no received signals.

I also hear a very high pitched tone coming from the radio, but it's not coming through the speaker or headphones (both are unhooked). It's something else.

From what I can gather by reading various posts here and elsewhere the likely culprit was a built up charge on the antenna. So I should look at D31 on the RF board, or maybe the surge absorber near the SO239.

Does anyone have any other suggestions? If I had ready access to a RLS135 diode I'd just try replacing D31 but it seems everywhere is either out of stock or wants a minimum order of $40 or something.

Any advice is greatly appreciated.

Hi, Brian,
I had the same problem a couple of years back, I tried a
factory reset and it cured everything, might be worth a try.

Pop the bottom cover and locate a pad labeled RXB on the RF unit.
Check the voltage in RX, it should be ~8v. If less than 1v the D31 is
gone. The replacement for D31 is a MI204, not surface mount but much
heavier duty and end of problem.

Thanks very much Clif, that's what I was looking for.

I think that seals it, I found 1.3 volts. Also as suspected, briefly shorting TXB to ground brought RX back.

Thanks, I'll start hunting.

While you are in the neighborhood;
Check the collector of Q49 for ~8v in Rx. A spike usually gets it
also. Causes about a 20db drop in sensitivity. You can remove D31 and
check the Rx. Also look at all the control lines for the BP Filters.
Go to IC1 and check 1-7 & 9-11. All should be 11v except the one
selected and it will be low. Could have got one of the switching
diodes for the filters.

Brian,

As mentioned in my e-mail, check the voltages on the TRX board. There is an 8V common which outputs to either the TXB or RXB voltages. Can't recall the pin numbers. The TRX board is located on the IF board. With the radio upside down front facing you, up in the top right section you will see a bunch of small boards soldered to the main IF board. They are all labelled. The TRX board I think is the 2nd in line from the front. When I lost the TXB in mine one of the transistors was blown. The boards are available cheap from www.kenwoodparts.com

Hi All!
Does anybody know at which level VR17 in the RF board should be?
I mean the service manual says simply that the level should
be set up counterclockwise from max AF output until the audio level
drops...

My problem is that when I checked the RTX it was nearly all the way
clockwise and the receiver was very noisy. Now I did as the manual
says and it's much quieter, but I am not so sure it is correct!

In any case I understand that the S-meter should be set up again, and
I've never done it before even if I have a good scope and signal
generators.

Any help?

Thanks as usual,
marco

Hi Guys (and gals)

I have a TS-450SAT and for some reason the computer interface quit. I know
it is not the cable as I have another TS-450SAT and the cable works on it.
It was working fine, then all of a sudden, just quit. The computer can't
find the radio any more. Any ideas? Thanks and 73

Hi Martin, here is a link to some repair centers that
Kenwood recommends.
http://www.kenwood.nl/support/service/
Other than these I would just ask other hams in your
area for references.

Thanks very much Clif. I checked Q49 and it's good. All the levels on
IC1 are good also, and after removing D31 receive is as good as ever.

I ordered a few D31 replacements from east coast transistor (along
with a few other components for the rig in case I ever need them).
Just awaiting their arrival. Thank you for your time.

Tim,
Got the list of buttons, I do have them. There's always a 'catch', and I've got one too. This '850 is one of the first that came out, so, the buttons and everything else is sort of 'worn'. The 'other' part of the 'catch' is that being in Oklahoma, it'll probably be a while before I can get them out of the radio and shipped. It's not exactly very high on the priority list right now - lol.
I have no idea what new buttons would cost so will take your estimate on that. I'd feel a lot better if you'd have a look at them before deciding what they are worth (terrible to have a conscience, isn't it?).
If you don't mind a wait, I'll get them to you and then we can go from there. If they aren't what you expect, no problem, just send them back. If you'd rather find buttons else where, that's not a problem either!
So, what do you think?
Paul / W5LZ

PS - And if by chance you have one, I'd be more than willing to swap buttons for a portable generator! Or maybe a couple of hundred gallons of gas?? LOL

Hi Paul -
That sounds very, very nice of you and most appreciated. Whenever it is convenient for you go ahead and send the buttons.

The buttons on my rig that I am replacing have 50% - !00% of the lettering worn off. So if yours are reasonably legible then I am ahead of the game. Pacific parts charged $1.04 per button when they were available.

If you are comfortable sending me the buttons and then having me send you a check as you suggest - that's a great idea and very kind of you. Thanks!!
I'm good on QRZ.COM but here is my info:

I have Inrad 500hz filters on both boards and now want to install a 2.1 Inrad adjacent to the 500hz on the 8.83 board. I've not seen Kenwood filters but the Inrads will not fit side by side so it looks as if it's necessary to extend the connectors mounted on the pc board with a cable and mount the 2.1 filter a bit further away from the stock location. If anyone has already done this I would like to know where to order a cable that would extend each of the 5-pin and 3-pin connectors. I don't know what a radio technician would call this cable - so a name and / or part number would help! Thanks in advance for any help. Tim / NZ7C

5506. TS-850 Distorted TX

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-01-21 16:53:01 UTC
From: Ron
Topic: 5506 Message: 5506

I have TS-850SAT that has distorted transmit after taking quick shot of 24-26 volts when diode blew on my PS-52. Receive is wonderful no matter if unit is cold or warm. Although distorted, people can understand me and distortion is constant and consistent. I have replaced the DC-DC board and done the ALC fix. In process, found the gas arrestor tube blown and replaced it. Battery shows 3.2 volts with no apparent leakage. Checked the caps on the CAR board and all look good. DDS chips are 66312. Thinking DDS is cause but all posts to the group mention distorted receive as well as transmit, which is not my case. From looks of DDS chips, not sure I have skills (or magnifying glass strong enough)to replace.

Before I send it out, is there something else I should check?

Thanks in advance for any advice.

Check the bias on the finals and drivers. The base voltages should be .6-.7v in Tx. Measure in SSB with no mike hooked up. Zero volts indicates a bias circuit problem while a higher voltage is usually a leaky driver or final.

Actually, I don't want to change it. I read somewhere it can be
changed through the menu but my menu doesn't address it, thought maybe
I was missing something...

I Have an Icom Ic-706mk2g in like new condition,includes OPC-581 Separation kit(new in package),MB63 Mounting bracket(new in Package)all acces.cables that came with new.Also includes CR-282 High Stabilty Crystal(never installed) & Icom FL-223 1.9 khz SSb filter.Stock mic,All Boxes,Manual,pwr cables as well
Also is a SAMSON C01 Studio condenser mic, all cables and hook ups for icom, And a new peavey pv-6 mixer for that great hi-fi radio station (box and manual included).it also included a LDG AT-11MP autotuner with all cables for icom .
Also I have a TS-850sat it works but is locked in band scan mode. when using vfo, but memory mode works as it should.(maybe easy fix), Comes with power cable mc-60 mic and ps-53 power supply,it has ssb filter as well,
NOW WHAT I AM LOOKING FOR.
I WILL TRADE ALL ABOVE FOR A LATE MODEL TS-2000, OR EVEN THE COMPUTER MODEL

This may have been answered a thousand times, but as a new member I hope you will humour me. Is there a serial no. range as to the "leaky battery" problem with the 850? I recently acquired an excellent condition rig that I really enjoy using and didn't want to have to take the covers off to check if there is another way of knowing if it may or may not have the problem. Thanks for the info. I'm sure there will be more questions to come. Rich KM5WX

5518. Re: TS 850 battery question

From: Clif
Topic: 5517 Message: 5518

Not really. Best to just look. Pull the battery away from the PCB and look closely at the seam on the back. Any trace of white powder and it needs to be replaced. Not necessary to unsolder it to check it.

Clif

If the battery is over 5 years old CHANGE IT. They all leak after 5 years. do the remote mount mod. so if it does leak it will not destroy the traces on the board.

73 and Enjoy the great rig.

From: rovntoma
Topic: 5533 Message: 5533

Hello guys
I got a very old collins mechanical filter from old Collins radio.
It is cylindrical 2,7khz upper SSB filter for 455khz type F 455 Z4
7437 and p/n 526 9364 00.Have 3+3 pins on sides.I try install it to my
450s for 455khz filter place.Performance is very miserable.Signals
9+30 is dropped to 3 over this filter.I tried all variations of filter
pin. conections(in,out,ground).I find proper pins on filter board from
manual 450.The filter give impedance 50 ohms between pins via
multimeter,but nothing impedance across the filter.Maybe the filter is
very old and non resonable,or electrical parameters ts450 are
incorrect for this one.Have somebody any idea?
Thanks Tom

Hello All,

International Radio, the supplier of inrad filters, offers a so-called VHF roofing filter for the TS-850 as well as for other transceivers with 70 MHz first IF's. (70.05 In case of the TS-850/950)

The offered kit is just a filter from what I understand, no installation instructions , gain loss compensation or measurements.

Has anybody experiences or any thoughts about this?

A good roofing filter is perhaps the main factor that sets the 850 apart from the high priced newer transceivers.

Hello Steve,

The info is here:

http://www.qth.com/inrad/

Page header: "Crystal Filters"

Look under "Filters for Experimenters" and "VHF Filters (for
experimenters)"

Then under "73.05 MHz and TS-850/TS-950SDX"

Hope this helps.

Topic: 5535 Message: 5540

Hello Randy,

There are many places where you can find good descriptions about
"roofing filter"

http://en.wikipedia.org/wiki/Roofing_filter

I will give another short one here.

Most modern receivers have a front-end consisting out of a mixer and
a crystal filter and a second mixer following the first..
Look also for "high" and "low level" mixers.
The newer designs have a mixer and mix up to an IF anywhere from 40 to
70 MHz
This makes the mixing easier vs like using an IF of 9 MHz, 1.6 MHz or
even 455 as
a first IF. It also makes continuous coverage easier to accomplish. (
100 KHz to 30 or 60 MHz)

Mixing is not always a clean process and particular is one is
receiving strong signals
(like in contests or on 40 meters to give just an example)
In such a case the mixer might produce other than just the sum or
difference of the
incoming signal and the LO. Particular if the More than one strong
signals are
in the pass band of the first filter. It is hard and relative
expensive to build a
40 or 70 MHz filter with a narrow pass band , such as 2.1 kHz or even
500 Hz
pass band. There is another point the newer transceivers and even the
850
lets you receive FM. and that is another reason why the first filter
is often
15 or even 20 KHz wide.
In order to protect the 2d mixer against internally generated signals
in the 1 St
mixing process one likes to have the first filter as narrow as
possible IE,
2.1 kHz for SSB and 500 Hz or less for cw. instead of the 20 kHz as
some of the receivers have.
For receivers with the IF in the 5 to 9 MHz this problem is different
as it is
easier to build filters at the frequencies in the required bandwidths.
such as Tentec and the like.

So an after market developed for roofing filters as replacements for
the
first IF filters.

You might search for W8IJ and Sherwood engineering (see Drake R4C
and
600 Hz roofing filter) and you will find more detailed explanations
for the
these effects

Hope this helps

5541. TS-850 Roofing filter.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-02-06 16:46:21 UTC
From: observer35
Topic: 5535 Message: 5541

Hi Steve,

On the cw filters, there is quite some info available on the internet.
If you Google for "Inrad 103, 104, TS-850" you will find all sorts of
experiences, mostly quite positive.

I just bought an Inrad 70.05 MHz CW filter , 400 Hz BW and will let
you know about my experiences.

I see the roofing filter issue as a more important one.

Here are some of the links:

Group,

The big problem with a 400 hz - 73.05 Mhz filter is the the radio will be unusable on SSB - Typical 73 Mhz filter for 1st IF is 15 Mhz - so that it will accomadate AM.
You will need to be able to switch this filter in and out to make it work on anything other than CW. Do a search on Google for Sherwood engineering and see what he says about roofing filters!. In any rate I am curious to know the results! A switchable Roofing filter for
the TS-850S would make it a very competive radio!

Hi Bill,

You are right. It transforms the receiver in a CW receiver only that is with a 400 Hz roofing filter,
The inrad 103 is a 8 MHZ filter and can be selected from the 8 MHz filter switch.

The roofing filter I am trying to get experiences from has the following specs.

Bandwidth : 5 kHz typical
Insertion loss: 5 dB typical
Case: Shown below

Input/Output match: 50 Ohms
Operating level: 0 dBm maximum
Isolation: -60 dB typical

This would probably effect the SSB behavior some what but would be acceptable
and of course it would nor be as good as a 400 Hz Bandwidth filter.
I don't know of any 70 MHz center freq. filters with that kind of bandwidth < 1 kHz
The much installed roofing filters for the Yaesu FT-1000xxx transceivers are also > 1 kHz

From the IRC web page:

" We also have a Roofing Filter mod which has a steep sided, 4 to 5 kHz bandwidth filter plus an
amplifier which makes up for the filter insertion loss. This mod has much of the benefit of the I.F.
mod and in addition it reduces the close in IMD. This is particularly important for stations with
big antennas or stations which regularly receive loud signals. "

I believe that for the Yaesu and other receivers IRC, has done the design and made the measurements
and for the TS-850 they have not done so.

Inrad is currently working on a roofing filter kit for the TS-950 SDX. That is very close to the 850 so that might be an option. I am told it will be available around June this year... Yes, I plan on purchasing a kit as SOON as it is available...

All,
It seems as though the applicable TS-850 series experimenter's roofing filter from INRAD has a 5 KHz bandwidth centered at 73.05 MHz. This is perfect for those interested in SSB and narrower modes. In a salable form, this would be quite an upgrade! I've already voiced my interest if one comes available in coming months.

If you don't use FM at all then a 6KHz or 8KHz would work for AM and narrower modes. If you don't do AM or FM then something in the 3KHz range would work good for SSB and narrower modes. This is my understanding anyways. If you could set your radio up so you could select from several different roofing filters, this might be the best choice. I know on the Drake R-4C if you go too narrow on the roofing filter you will run into pumping. This happens when some opeators replace the 8KHz roofing filter for a 6KHz filter. Some have found that just going with a better roofing filter has helped a lot with the Drakes.

5552. TS-450 need help. Very low receive audio

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-02-07 00:11:50 UTC
From: ron
Topic: 5552 Message: 5552

I have a TS-450 and everything seems fine except the receive audio. If you put your ear close enough to the speaker you can bearly hear the audio, but it is receiving signals. This is with the AF and RF turned fully clockwise. I have just got this radio used so I could be doing something wrong but I don't think so. I've owned similiar radios in the past. Does anyone have any suggestion as to what I may be doing wrong. Or have any ideas as to what might be the cause internally? What part to check or replace? If checking a part, what to check for? Any troubleshooting methonds? I do have the operators manual. Thank's

plug in a pair of head phones and see if it works if it does the
speaker is faulty
if the head phones have the same fault its the radio

Thank's for the replies. I have checked the squelch and I have
plugged in an external speaker and headphones witht the same results.
I can see strong signals on the meter, I can barely hear the audio,
but it is readable. I can hear whats being broadcast if it's loud
enough.--- In TS-850_450_690@yahoogroups.com, "DaveH" <w2drh@...>

From: ron
Topic: 5552 Message: 5559

Does this radio require a microphone for the receive audio to work properly? The mic with it is a Kenwood MC-35S with a 4 pin plug attached to a 4pin to 8pin adapter which is plugged into the radio.

5560. Re: TS-450 need help. Very low receive audio

Topic: 5552 Message: 5560

No - This rig will work fine on Rx without any mike. There is a fixed audio output at the accessory jack on the rear panel, and for now you could hook up a decent PC-speaker/amp system there and start checking out the rig for any other clues. Presuming thet the constant-level preampo out is fine, you could take your time with a scope and troubleshoot the Audio amp system.

Worst case is the whole amp is shot and if so, it may be practical to bypass the amp with a suitable amp circuit that you install between the volume control and the speaker, and troubleshoot the amp carefully. Check power supplies ariund the AF amp, and suspect capacitors.

Good luck

From: genesisjoe2001
Topic: 5561 Message: 5561

I just picked up a very nice used 690 with no additional fliters.
I prefer CW but operate a bit of SSB.
I need some advice as to whaich filters to add.
Which 500 Hz CW fliter should I get and should I cascade to CW fliters
or put one CW filter and one SSB fliter in it.
I don't have the istruction manual yet but as I understand you only
have two filter slots correct?
Thanks in advance for any advice.

Most likely:

C104 in the IF unit has leaked and damaged the traces. If you don't
have a manual I will post pictures of where it is.

Topic: 5561 Message: 5564

The 450/690 has 2 filter slots in the 8.8 IF and 1 in the 455 IF. In filters always start with the closest to the antenna. The earlier you can cut out excess garbage the better. In this case the 8.8 IF. You can use any of the plug-in 8.8 filters which are identified in the PN by a -1 at the end. YK88SN-1, 1.8kHz Narrow SSB. YK88C-1 500hz CW. YK88CN-1 270hz CW. In the 455 side again use the -1 filters. YG455C-1 500hz CW. YG455CN-1 270hz CW.

Most hams use the YK88SN-1 and YK88C-1 combo with the YG455C-1 in the 455 IF.

If you're not a CW operator then just the narrow SSB. If you want to try the digital modes (PSK-31 etc) add a YK88C-1.

5565. CAT interface on the TS-450

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-02-07 19:22:15 UTC
From: sparky_622000
Topic: 5565 Message: 5565

I'm pulling my hair out! I built a cat interface for my ts-450 but I can't get it to work (at least not completely). I can send commands TO the rig and they are executed but get no responses or status requests back.

I already know about the inverted data lines. Is there something else I'm missing? I have used a logic probe on it and have verified proper levels at all the pins of the acc-1 connector. The rig is just not sending any data.

One thing I did notice while looking at Kenwood's IC-232C interface schematic is a 555 timer that looks like it provides a delay to the rs-232 lines out to the computer. Don't know what the purpose of it would be but of all the interface schematics for the 450 I found, none of them use the timer.

If anyone could help me, It would be very much appreciated.

Chris - KC0TKS

5567. TS-450SAT Calibration Cable - What is it, exactly?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-02-08 00:44:22 UTC
From: ve9xyz
Topic: 5567 Message: 5567

My TS-450SAT was purchased used, and the operator that sold it to me was rather peculiar about NOT including any accessories (no mic, power cord etc etc - I figured it was honest-to-goodness withdrawl pains).

The handbook talks about calibrating the rig with this thing - and I'm wondering if I couldn't just make up a cable of my own with a small shielded cable and suitable connectors. Look like the small header-mount connectors such as found on PC and junker radios.

Can anybody describe this in detail for me?

I'm not likely to need this anytime soon, but the time to make one up is probably now while things seem to be working well.

Thanks

KEvin VE9-XYZ

Kevin, I can't accurately describe the calibration cable as I have not
seen mine in many years.
But going by memory it was just a hunk of skinny white wire maybe 8 or
10 inches long with a tiny connector on each end,
not a shielded cable.
Bud - KV7G

what in God's name are you trying to calibrate? I have had a ts450 for
years and nothing has ever been done to it. Did the previous owner mess with
the internals?

From: Zack Widup
Topic: 5567 Message: 5573

I don't have a 450 but my 440 included a little jumper cable that is supposed to be used to calibrate the reference oscillator with WWV. I've never needed to use it because the rig is accurate. The service manual (and I think the owner's manual) included directions on how to do it.

I did buy a used HTX-100 that was a mess - some CB'er evidently owned it and twiddled with all the adjustments. It wasn't too difficult to readjust, though (there isn't a whole lot to that rig).

Hey Dave - nothing to get anxious about... The manual describes why this might ever be neeed, and I'm not going to mess with something that's not broken to start with. As I pointed out in my note, I'd like to have one on hand before I need it some day.

The OM that sold me the rig gave me ample time to use it in his shack, but I think he was feeling regretful about selling it and that turned into a "no accessories included!" stance as the deal was being closed. I guess we can all identify with that, and 2 years later it has turned out to be a fine rig.

Yep Great rig,
DON'T do ANY recalibration of ANYTHING> IF something fails, ok fine. I just don't know what kind of "cable" you night need. If it fails you need test equipment and knowledge. There just isn't anything special in this rig. Simple electronics and components. I have service manual, if you are interested. I can send it to you in PDF format free of charge.
Just let me know. 73 Dave

From: ron
Topic: 5576 Message: 5576

Just fyi, if anyone is interested I saw a kenwood yk-88sn-1 ssb filter for the ts-450/690 and a couple other model radios on ebay. I think it has about 9 days left on the auction. Just thought I'd mention it in case someone was looking for one.

5577. Distorted TX audio on TS-450S

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-02-09 15:55:08 UTC
From: rocketradio2002
Topic: 5577 Message: 5577

Hi guys,

I'm new to this group. I was asked to sell a TS-450Sat for a friend, and I've grown so fond of the radio that I'll probably buy it myself.

Now as I was testing it I found distorted TX audio on all modes. The audio is very clipped. Turning the mic gain down to almost minimum clears it up, but there is no power output at this level. Running the mic gain at a normal level and lowering the power ouput doesn't affect the distortion. So I'm assuming that the TX audio circuitry is where to look.

I'm wondering if there are some common problems with this radio that could cause these types of symptoms. I've looked through the messages and didn't find anything that would address this.

Thank you for any help.

Look on the RF unit at the band pass filters and see if some of the
switching diodes are leaking.

Yes, the rts line is connected from the computer to the rig and the software is controlling it. I have even gone as far as to artificially pull it high or low at the radio. Either way, it still doesn't work.

I have tried several different programs and they all do the same thing. I have even used hyperterm and like always, I can send commands to the radio and it executes those commands, but returns no result.

I'm desperate so I am going to use a pic to mimic the responses of the rig. Does anyone happen to know where I could find the structure of the response messages? If I knew what the radio was supposed to be sending back, I could easily fool it into working for my purposes.

5584. TS-850S antenna tuner squeak

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-02-12 05:04:46 UTC
From: Brian Mileshosky
Topic: 5583 Message: 5584

Hi Everyone --

I just pulled my ATU out of my TS-850 and applied a little 3-in-1 oil to the bushings. Cleared up a lot of the squeaking, but not exactly all of it.

However, in re-installing the tuner to test it I noticed that it will not tune up on any band from 20 meters down to 160 -- and I'm feeding the radio into a dummy load which I know works. It seems to not be able to get below 1.5:1 to 2:1 and then the time-out alarm goes off. Repeated tried yield the same result. Everything tuned up fine into the dummy load before I pulled the ATU out for oiling.

Any ideas? I disassembled the unit, taking off the two pots and the plate that they are normally screwed to and took great care to re-install everything as I found them. I didn't turn the caps or gears when the pots were off.

Any thoughts would be appreciated.

The 850 is difficult to interface to transverters. Your best bet is the
Down East Microwave TIB-850, which allows you to use the radio both on HF
and with transverters without major cable switching. Otherwise, you cannot
easily switch between the transverter and HF usage.

Hi,
Just got my 850S a while back and trying to find the 6 pin Din plugs so I can go computer control. Anyone know of a source. Appreciate it.

I recently picked one up at www.pacparts.com. Think East Coast
Transistor also carries them.

Ron, Tks for the info. Pacparts will not help me without a part number. I've looked at their web site and can't find it. Do you happen to have the part number. East Coast Transistor was very helpful. However, the part has been discontinued, he cant get them. Thanked me and that was that.
Any help you or anybody else on the list can give would be greatly appreciated.

Hi Marty, if you are looking for the 6 pin plug and
cable assembly, the one that is used with the TS-850
and the DSP-100. The old number is, E30-3047-05, the
new number is E30-3047-15. I am sure this is right.
I just ordered one from, http://www.partstore.com/ and
they told me it was the new number. My cable was back
ordered also. Was to be shipped last Wednesday, still
waiting.

I have used my TS-850 with a ten-tec 28/29mhz to 144/145 mhz transverter.

Very easy to setup and use. Knock back the power to 10 watts on

850, setup menu on 850 to display 2 meter band, and you are

on 2 meters using TS-850, with 2 meter band readout on your TS-850.

73

John ZS5J

The 850 is difficult to interface to transverters. Your best bet is the
Down East Microwave TIB-850, which allows you to use the radio both on HF
and with transverters without major cable switching. Otherwise, you cannot
easily switch between the transverter and HF usage.

is possible to set power on in mW or up to 1w, on ts-850s.

so many people have made different mods to interface ts-850s with transveter, why if that is so easy?

ex. look at:
http://tk5ep.free.fr/tech/ts850/en/ts850_g.php#TS850S%20SEPARATE%20ANTENNA

best regards
samir, sm7vzx

Looking at the schematic for the RF unit. The jack next to the driver output can be used for a transverter. A cable plugged in there with 12v on it will switch the output of the RF unit to that jack. The level will be around +4 dBm on 20m (where my readings were taken) It should be less on 10m. It can be varied by applying ALC voltage on the remote socket.

While there on the RF unit the RX input can be brought out to the rear also.

mmmm I think to get it to mw will be difficult. My ten-tec transverter

can take up to 10 watts power from HF rig, so no problem for me.

is possible to set power on in mW or up to 1w, on ts-850s.

so many people have made different mods to interface ts-850s with
transveter, why if that is so easy?

ex. look at:
http://tk5ep.
<http://tk5ep.free.fr/tech/ts850/en/ts850_g.php#TS850S%20SEPARATE%20ANTENNA>
free.fr/tech/ts850/en/ts850_g.php#TS850S%20SEPARATE%20ANTENNA

best regards

According to ts-850s manual, minimum power to set ts-850s is 20w.

Also, according to manual, one need to move coaxial cable from CN26 to CN25. Now one can use IF OUT to drive transverter. So far so good.

Antenna contact on ts-850s uses for receiving, IF OUT uses for driving transverter.

QUESTIONS:
-IF OUT -> How much power we have here? 1W, 1mW or...nothing in manual.
-PTT on transverter, what to use from ts-850s to PTT the transverter, how?

Topic: 5599 Message: 5603

This is the way I used a TS-850S with a transverter, getting mw of
power. There are actually two ways:

1. Follow the instructions in the manual and change the internal
jumper. This gives mw of power out to run your transverter. The
problem is, you have to open up the radio and change the jumper back to
original position to use HF.

2. Buy a Down East Microwave TIB-850. This is their transverter
interface box that allows switching between the transverter and HF with
the single flip of a switch. It worked great for me.

The problem I had with the 850 is matching the very low output to a
particular transverter.

The better way to do all this is to buy a newer generation transverter
from Down East Microwave with relays, set up to run like a brick. RF
in, 28 Mhz at 10 watts maximum and RF out on your chosen band. Of
course you run into the same problem in terms of HF use. But, that can
be solved by using a coax switch to run RF from the transverter back
into your HF antenna system. BE SURE YOU DON'T FORGET TO TURN THE POWER
BACK DOWN WHEN YOU RETURN TO THE TRANSVERTER.

Here is the place to buy the transverter.

The manual states RF output from the IF OUT jack in the transverter mode is 0 to +10 dBm. You must inject +12V DC into the IF OUT port to switch the 850 into the transverter mode.

Hello.
I am a visual thinker, and a newbie in the HF digital modes. I have an old MFJ 1278 but no connectors. I have some surplus cables, and tools--but I need a snapshot of somebody's setup, so I can see what the connectors are going to look like when I'm through. I want to see the back--how did you interface FSK with the IDC connector, the RS 232, the whole works. Can somebody upload a photo, or send me a photo or diagram of each connector needed to use my MFJ 1278 with my rig and get started?
By the way, too--has anybody ever used a USB adaptor to connect your 1278 to a PC? Would this work?

The information on the pulse-trains, commands and codes are all in the "External Control Instruction Manual"; this will be available I think from the mods.dk website if you do not have it.
It's only 20 pages, so no big deal.
I did some research a year ago with the scope and after sending in a command I could nicely see the reply from the TS450, p.e. sending FA you get the frequency readout of VFO A.
If you use Logger32 and go into the radio control section you can have a debug window, showing what is sent to the rig and what comes out of it.
My problem is the interface with 7404, where the inputs are abt. 2 V; The TS450 of course is unable to override this; replacement 7404 gave the same result so for the time being I gave up on the frequency readout.

Subject: [TS-850_450_690] CAT interface on the TS-450

I'm pulling my hair out! I built a cat interface for my ts-450 but I can't get it to work (at least not completely). I can send commands TO the rig and they are executed but get no responses or status requests back.

I already know about the inverted data lines. Is there something else I'm missing? I have used a logic probe on it and have verified proper levels at all the pins of the acc-1 connector. The rig is just not sending any data.

One thing I did notice while looking at Kenwood's IC-232C interface schematic is a 555 timer that looks like it provides a delay to the rs-232 lines out to the computer. Don't know what the purpose of it would be but of all the interface schematics for the 450 I found, none of them use the timer.

If anyone could help me, It would be very much appreciated.

5608. TS450: transmit power down...

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-02-17 22:05:07 UTC
From: Cormac & Suzanne Gebruers
Topic: 5552 Message: 5608

I've a 12 year old TS450 SAT and its never given a days trouble. Recently I made the decision that it was time to buy an additional HF rig (FT2000). The 450 must have heard me as its appears to have started sulking...

Recently (in the past 3-4 months) the transmit power has been dropping very gradually. At this stage power has fallen away to about 80 watts or so. This isn't an antenna mismatch or anything like that - its definitely the rig. The power is down with the ATU in or out - it doesn't seem to matter. In all other respects the rig is still operating perfectly.

Is this just the finals getting old (I guess such a thing happens?), or could it be something else?

Advice?

Rgds
Cormac, EI4HQ

Hello Terry,

Can you draw simple schema how to make this work (interfacing transverter [Elecraft XV144] to ts-850s). The manual of ts-850s is a little bit confusing.

On transverter [Elecraft XV144] side I have:
KEY IN (key line)
TXin/IF1
RXout/IF2

Thank You

Larry,

As I remember, Yes. All you have to do is resolder or reinstall the two jumpers that were removed or cut when the TXCO was installed. I removed mine. Some where around here I have the spec. sheet on the TXCO. But I don't remember it having anymore information that what you would find in the manual. Looking in my TS-690 (450) it states

1. Remove the top cover of the transceiver.
2. Remove the speaker fitting.
3. Remove the shield cover of the PLL unit.
4. Disconnect coaxial connector CN3 of the PLL unit. Remove the screws holding the PC board and lift the board.
5. Cut jumpers W4 and W5.
6. Solder the SO-2 to the indicated area.
7. Insert coaxial connector CN3 and tighten the screws holding the PC board.
8. Reinstall the shield cover and speaker fitting.
9. Reinstall the top case of the transceiver.

Looking at my manual for the TS-850 it states

1. Remove the case. Refer to Section 6-6-1
2. Remove the CAR unit.
3. Disconnect connectors CN5 and CN9 of the PLL unit. Remove the screws holding the PCB, and remove the PCB.
4. Cut jumpers W1 and W2.
5. Attach the SO-2 to the indicated area. Some models may come with the SO-2 factory installed.
6. Insert CN5 and CN9, replace the PCB and carrier unit in their original positions, and tighten the screws.
Note: Avoid catching your fingers and wiring harness when closing.
7. Replace the top and bottom covers.
Note: Avoid catching your fingers and wiring harness when closing.

I hope that this helps. This should be all of the information that you would need to remove a SO-2 from a TS-450 and Install it in a TS-850.

I will look and see if I can find the spec sheet that came with my SO-2 if you would like me to and send you that information also.

The instruction sheet for the SO-2 Says basically "solder it in"
That's it, nothing else unless you can read some Japanese writing. It
is worthless. The owners manual for the radio tells what to do.

Hello, TS-850.

Hello, everybody!
Recently I have asked about this(yk-455c-1) filter .... Thanks a lot
for the answers ...
But I am very interesting is this quartz(as yg-455c-1) or
mechanical filter...? Nothing found about it in the net ...
If anybody has this info please inform me ... Thanks and the best
wishes from St.Petersburg...

Best regards,

I just purchased a Heli Microphone EQ and need a cable that can go between the EQ and my TS-690.
Are there any pre-wired cabled for this job?
Thanks in advance.

Check out http://www.mods.dk

I know in the 440 and 850, you open up the transmit range to the entire shortwave spectrum by removing a diode. I have done this mod to my radios (I use it responsibly - i.e. only on 60 meters and with transverters with oddball IF's like 22 MHz).

If it can be done (and based on other Kenwood radios I imagine it can) full instructions will be at the mods.dk site.

5626. TS-850SAT 15M Distortion And No ALC

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-02-26 03:44:44 UTC
From: Ken Winterling
Topic: 5626 Message: 5626

Good evening,

I have an interesting problem for you TS-850S repair experts regarding a problem on 15M (21mHz). I will describe it in a moment but first a bit of background. I have two TS-850SAT on the bench that belong to a friend of mine, a good bench tech. He has tried for a while to resolve the problem, identical in both rigs, and finally gave them to me to get a "second opinion" and a fresh approach. I, too, have been unable to correct the problem in either of his rigs. He also owns a third TS-850SAT that has the same problem but he is using it in his shack and I have not tested it.

The serial numbers of his three radios range from early to late production and have both the old and new DDS chips. All three have the internal antenna tuner. We also have a few friends who own a TS-850SAT. All of them have serial numbers in various ranges and contain old and new DDS chips as well as internal antenna tuners. My friend has duplicated his 15M test on three of their rigs and all but one exhibit the same problem.

Now for the problem and test set up. All of the rigs, with the one exception noted above, work properly EXCEPT on 15M. On that band, unlike the other bands, if you turn up the mic gain you do not get any ALC indication on the internal meter and the output power continues to climb. The transmitted signal becomes quite distorted and broad as monitored on a separate receiver.

The test equipment set up consists of a 2 tone generator connected to the front panel mic jack, an oscilloscope monitoring the transmitted RF signal, and a dummy load connected to the transmitter. Injecting the 2 tone signal while the rig is set to 15M and increasing the mic gain produces a test pattern on the oscilloscope that flat tops and broadens as the mic gain is turned to maximum. There is no ALC indication on the rig's meter and the RF output continues to climb. On the other bands a point is reached where the power output does not increase even if the mic gain is advanced to maximum and an ALC level is indicated on the rig's meter. This is an indication that the ALC is working. The same test has been repeated on all of the other rigs with the same result with the one notable exception mentioned above.

The above behavior leads us to suspect that the ALC is not functioning on 15M but we can not determine the cause. We do not believe the vintage of the DDS chips plays a part in this since rigs with both old and new versions are affected in a like manner. My friend made an interesting observation regarding power output. He noted that if the "all power down" switch on the RF unit is set to the low power position, approximately 50W, all of the rigs operate normally on 15M with good ALC action on all bands. This switch is common to all bands so we do not see how this should affect operation of

the ALC on just 15M.

We need your help. If the problem was confined to one rig we would keep digging, parts swapping, or take the "shotgun" approach. However, five (5) rigs have been observed exhibiting the same behavior so we are considering there may be a design issue. If you have the proper test gear we would appreciate it if you would repeat our test on your rig and report your findings. If you don't have test gear you can still check ALC action and power output on 15M compared to 80M or 40M. Listen to your 15M signal if you have another receiver. Report your findings.

Thanks to all for your assistance,

Ken, WA2LBI

Did anyone successfully find if this is possible with the TS-450SAT? I looked at the mods pages everyone mentioned, and basically were the same things. With the diode mod, I can rx to 40.000.

Did I miss something? I'd love for my 450SAT to act like a TS-690 but have strong doubts.

There is only 1 OOB mod for the US 450/690. It is the Mars/Cap mod. It allows TX from 1.5-30mHz continous. I think you will find 60m is in that range somewhere.

Topic: 5626 Message: 5630

Ken,

Having experience with several different 850's, I recognize the situation you describe. I suggest that you make the service manual adjustments (VR7 etc) for proper adjustment of alc and power with the radio set to 15m. For some reason, if you do the procedure as suggested for 20m, or any other band, 15m will then behave the way you describe. Dunno why they're finicky that way, but if set to 15 first, the other bands generally fall in line. You may not get the same range of alc reading on each band, but you should be able to get 100w (or more) power everywhere without distortion.

If K0ZL is reading, he may provide a more technical description.

5631. ts850 birdies and AF-RF pot

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-02-26 23:13:30 UTC
From: weak_signals
Topic: 5631 Message: 5631

Hello all
I'm new.

Of course I'm looking for the DSP-100.
I have a broken RF/AF pot. The AF inside one turns all the way around.
Anyone have one?
Where should I get one?

I have signals that shouldn't be there on an 850
I was able to do a side-by-side test with another 850.

With and without the antenna there are signals with narrow separation
on the band about 6kc.

The birdies are not as noticeable with the antenna, but still quite
apparent.

I think I heard the birdies on 40, 30, 20 meters.
I suspect they will be on all bands

I suspect a loose connection or a capacitor on the display / logic board?

Anyone run into this?

5632. Re: [TS-850_450_690] Re: TS-850SAT 15M Distortion And No ALC

Randy,

THANKS! At least it is something to try. If this is indeed the problem it would explain why so many of them we checked behaved the same - they had been aligned according to the factory service manual. I had followed the service manual procedure when I could find nothing wrong and ended up with no change when I was done. I expect to get to one of the two rigs sometime this week and will report my results.

73,

5637. MFJ1278 TNC to 850 8-PIN Please check my connections.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-03-02 01:10:30 UTC
From: kc7fys
Topic: 5637 Message: 5637

I'm soldering up a connector to connect to my MFJ1278 TNC.
Am I OK with these connections?

5PIN DIN Connector>8-PIN KENWOOD
1.Mic Audio>1
2.Ground>7,8
3.PTT>2
4.Rec.Audio>SPKR (does this mean the pin of the spkr jack?)

A pigtail 5-PIN DIN cable comes with the MFJ, but I have a DIN plug
and a pigtailed Kenwood 8-PIN plug and cable from Akihabara, Tokyo.
Are my above connections correct for this radio? And what about FSK?
And... shouldn't I be using one of the accessory jacks on the back
instead of the front mic connector? (I've owned the radio for years,
and never had the mic plugged in--I'm a CW operator, primarily--moving
into HF packet.)
Best regards, and thanks for any/all comments. (You won't hurt my
feelings if you point out glaring errors in my thinking--I'm still
learning.)

You would be ahead to use the 13 pin Din ACC2
connector on the back of the radio to connect to the five-pin connector of
the MFJ.

This will provide receive audio to the MFJ at a fixed level so will not
require adjusting the volume control for receiving and let you keep the
speaker volume at a good listening level or down to not be heard.

If you use the mic connector approach you'll have to take the wire for pin 4
of the 5-pin connector from the MFJ to the external speaker jack on the back
panel of the radio. You will have to adjust the volume control for best
operation of the
MFJ and live with what ever is coming out of the speaker while operating. It
may be too high or to low for comfortable listening.

The 13 pin Din is more difficult to solder but worth the effort.

For the MFJ the hook up would be

MFJ 850 13 pin or 850 mic connector

1 TX audio 11 1
2 Gnd 4 or 8 or 12 7 or 8
3 PTT 13 2
4 Rx audio 3 NC - go to speaker
jack
5 NC

bud N0IA

Jonathan,

I agree that you should use the 13-pin ACC1, but perhaps with a change from what Bud suggests: for PTT in principle you should use pin 9 for digital modes, which mutes the front-panel microphone connection (although if you don't have a microphone plugged in, this works the same as pin 13). Also, note that there are three grounds on ACC2; 4 is the ground corresponding to AF out 3, 12 is the ground corresponding to AF in 11, and 8 is the ground for PTT (9 or 13). The MFJ ties all three of these grounds together in its pin 2.

You also asked about FSK. IIRC, this only works on RTTY and AMTOR, not on Packet. On the TS-850, FSK RTTY keying is through a separate RCA jack on the back of the radio. On the MFJ-1278, FSK is taken from the TTL header - the FSK pin is 3rd from the right. So you would need to make up a separate cable from the TTL header to the 850's FSK keying input to do FSK RTTY.

There is a possibility that your FSK RTTY keying will be "upside-down". If this happens, there are two ways to adjust the polarity. One is inside the MFJ, on JMP14. The other (easier) one is the TS-850's power-on menu item number 11.

All that being said, I have found that the free MMTTY software is FAR superior to the MFJ-1278 for RTTY (AFSK and FSK). There is also sound card software available for Packet - I have never tried HF Packet, so I can't tell you how well the software works.

73,
Rich VE3KI

Jonathan, I can't speak to the accuracy of your connections, but I can offer a few suggestions.

The 13-pin DIN connector sounds like the better route, but as has been pointed out, it is a bear to connect to. If you cannot get a pre-wired 13-pin DIN with pigtail, you might want to go to Radio Shack and pick up 9-pin RS-232 connector kit with loose female sockets (or carefully break up a spare female RS-232 connector). Make your connections to the loose sockets and then just slide them on the pins at the rear of the 13-pin DIN plug. Some small heat shrink tubing over the sockets provides a little additional grip on the DIN pins.

Since you already have the pigtail for the TNC, consider using a terminal block to connect the two cables together. That way, if you ever change rigs or TNCs, you can re-use at least half of your cable without having to cut off an end.

Regards,
Ed

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-03-04 20:30:39 UTC
From: Ken Winterling
Topic: 5626 Message: 5647

Randy,

I spent a couple more hours on this rig (no ALC on 15M and distorted 2 tone output) and have not made any significant progress. I did as you suggested and used 21.200 while adjusting VR7 etc for proper adjustment of alc and power. I don't have a spectrum analyzer or a tracking generator so I can't do a proper job of aligning the BP filters as specified in the service manual. I get an ALC reading is every other band except 21-22.

Do you, Bill, K0ZL, Clif, KA5IPF, or any of the other TS-850S service experts have any further words of wisdom?

Thanks,

Ken, WA2LBI

5648. MFJ 1278/ACC2 connections Part II

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-03-05 01:18:35 UTC
From: kc7fys
Topic: 5648 Message: 5648

You would be ahead to use the 13 pin Din ACC2 connector on the back of the radio to connect to the five-pin connector of the MFJ.
This will provide receive audio to the MFJ at a fixed level so will not require adjusting the volume control for receiving and let you keep the speaker volume at a good listening level or down to not be heard.

OK, I'll use the 13PIM ACC2. I got the connector in Akihabara yesterday. Bud, you advised thus:

MFJ 850 13 pin or 850 mic connector
1 TX audio 11 1
2 Gnd 4 or 8 or 12 7 or 8
3 PTT 13 2
4 Rx audio 3 NC - go to
speaker jack
5 NCI'm pleading my own idiocy on this one, fellas. I see five choices for pin 2's ground connection. And then Richard goes on to say...
I agree that you should use the 13-pin ACC1, but perhaps with a change from what Bud suggests: for PTT in principle you should use pin 9 for digital modes, which mutes the front-panel microphone connection (although if you don't have a microphone plugged in, this works the same as pin 13).
So, for pin PTT (pin3) I can use 9 or 13 to the same effect. I will use 9 as per Richard's advice.
Also, note that there are three grounds on ACC2; 4 is the ground corresponding to AF out 3, 12 is the ground corresponding to AF in 11, and 8 is the ground for PTT (9 or 13). The MFJ ties all three of these grounds together in its pin 2.
OK, so then pin2, ground will be soldered to pin 2 of the 13PIN DIN connector. Bud gave me five choices, Richard suggests pin 2, so I'll put 'em all together and use pin 2.
You also asked about FSK. IIRC, this only works on RTTY and AMTOR, not on Packet. On the TS-850, FSK RTTY keying is through a separate RCA jack on the back of the radio. On the MFJ-1278, FSK is taken from the TTL header - the FSK pin is 3rd from the right. So you would need to make up a separate cable from the TTL header to the 850's FSK keying input to do FSK RTTY.
Do you fellas use a TTL plug of some kind? I'm sure this is available, but since it's such a simple connection, I could use PC jumper wires with the tiny single-pin socket on one end.
There is a possibility that your FSK RTTY keying will be "upside-down". If this happens, there are two ways to adjust the polarity. One is inside the MFJ, on JMP14. The other (easier) one is the TS-850's power-on menu item number 11.All that being said, I have found that the

free MMTTY software is FAR superior to the MFJ-1278 for RTTY (AFSK and FSK). There is also sound card software available for Packet - I have never tried HF Packet, so I can't tell you how well the software works.73,Rich VE3KIThank you Richard and Bud. I'll wire like this:

1 > 1
2 > 2
3 > 9
4 > + audio output (to pin of speaker jack)
5 > no connection

Am I OK now?
Thanks, folks.

Topic: 5648 Message: 5649

Jonathan,

Bud gave you pin numbers for both ACC2 and for the Mic connector.
They are totally different and you have them confused. For ACC2:

MFJ pin 1 - connect to ACC2 pin 11
MFJ pin 2 - connect to ACC2 pin 8
MFJ pin 3 - connect to ACC2 pin 9
MFJ pin 4 - connect to ACC2 pin 3
MFJ pin 5 - NC

73,
Rich VE3KI

Bill,

Thanks for your response! My friend and I have been working for months on several TS-850 rigs owned by him and others that all behave the same. We were convinced it was either an alignment issue, addressed by Randy, K9OR, or a design problem. It seems you have confirmed the latter.

While I wait, anxiously, to hear your report on the driver substitution, I will check the items in the last paragraph or your reply.

73,

Ken, WA2LBI

Subject: Re: [TS-850_450_690] Re: TS-850SAT 15M Distortion And No ALC

Gents,

This is a problem with all 850s, having lower TX overall gain on 21 megs
than anywhere else; otherwise they would be 120 watt rigs.

I have played with mine "somewhat" in attempts to get the TX IF and
post-mixer stage gain up a bit, all to no avail; it would seem that the
transmit overall stage gain is pretty much "firewalled" due to the excessive
(to me) looses in the 15M bandpass filters.

One thing I have not tried is changing the drivers to a high-beta pair from
RF Parts; I think they can hand pick some matched pairs for higher gain.
This would feed the '2879s properly and perhaps allow us to develop some ALC
at 100 watts on 15, maybe even more.

The development of ALC is crucial to preventing or limiting TX overdrive in
the earlier stages; of course the '2879s are capable of a LOT more output
than one would expect; the excessive third order distortion comes primarily
from the earlier stages, because they are working very close to their "rail"
voltages and saturation.

Perhaps a high-gain pair of drivers would relieve the situation. Stock are
2SC2509, perhaps the 2SC3133 or 2SC1972 would be a better choice. I will
endevour to try a pair next chance I get. The 1972's are used in the TS-2000
to good effect.

In the meantime, make sure that the TX BALANCE adj VR3 for Q26 and Q27 is
properly adjusted; that the sources of both transistors are showing about 2
volts to ground in TX; that D3 rx diode switch is not leaching TX power to
ground in TX mode, and that t8 and r8 switching is correct.

good luck!

bill

Another observation - if you run the 850 at higher voltage - as I have done on occasion at 15.8v rather than 13.8v - the ALC seems to act a bit more as expected, plus a little more power headroom, depending on the 850.

I am selling my TS-850S with the built-in antenna tuner.

Please look at the pictures below.

This rig is in excellent condition. I am the second owner. The first owner was an older gentleman who had long fingermnails. If you look closely at the upper left hand corner of the front panel you with see that some of the lettering has been rubbed off by his fingernails. That is of course no big deal.

Also, if you look very closely at the top of the rig, you will see some very light rubber feet marks from a speaker of something that was once set on top of the rig. Here again it is no big deal but I thought you should know.

Electronically, the unit is perfect. Output is a full 100 watts. A couple years ago I had B&B Technical (Kenwood specialists) completely go through the rig, in addition they did all of the updates and modifications. MARS, 60 meters, etc.

The rig comes with the Original Manual (not a copy), the original Kenwood hand mic, the power cord, a relay cable for use with an amplifier and the original TS-850 box.

I will double box this unit and ship it insured via UPS. Shipping with be the actual UPS charge from my zip code to yours. My zip code is 80439. The packed shipping weight is 34 pounds.

You can check the UPS shipping rates at: http://..ups.com

I am located in the Denver, Colorado area if you want to pick it up.

The price is $650.00.

Please make payment by PayPal, money order, Cashier's check or cash.

I will ship this Internationally.

This TS-850S AT will be sold on a firs come basis.

I have the 13-pin and 5-pin DINs wired up and connected. The RS232 connected--now what software should I install for my first HF data mode QSO? What is the best and easiest software to get started enjoying digital modes with the MFJ 1278? I know it's not one of the easiest TNCs to use, but I want to use it, since I paid for the darn thing.
Best regards,
Jonathan

any terminal program will work there are several on the internet that are FREE

paket 6.1 or 6.2 is free, does packet only

try a google search...

.but it will depend on what mode you are trying to do

..not sure what mode you are trying to get on..cw??rtty??amtor????fax?? sstv????

I find it easier than kam or pk232, because it does NOT rest in host mode like the others, but make sure it is not in kiss mode. have you downloaded a manual, or do you have original ...a lot of reading to do this. would be easier if a local uses tnc and can show you first hand

the rest is something that the 850 users may not be able to help furthur, unless they have a mfj1278, and then it would be better direct to each other. simply turning on and go is not what can be expected

check the manual, yes it has to be set on int, at the back, thru/auto has to be pushed in, then you should be able to press at tune , and it should tune, as long you are within atenna tuners max range (i forget what that is)

I think there may be a menu item for whether it tunes automatic when band changes.

Hi Mike

Did you go into the menu and switch it to 'on'? There is a setting to
either select autotune on or off. Not sure what the number is, but if you
have the manual, it will tell you. 73

Hi Mikw,
Wecome to the wonderful world of 850s. The menu number you want is number 20. Also in the manual, there is a para that says"
This switch will not function when the CAR control is turned fully counterclockwise". Page 30.

Is the auto switch off not working, or does the tuner not respond, if switched on, if 2nd symtom, read the manual, if first, try CAR fully clockwise, if it doesnt help, you have to solder some points on the filter board, as mine :-(

go to Kenwood site and down load the TS-850 manual. It appears very easy to install with detailed directions.
http://www.kenwoodusa.com/support/simple.aspx?men=2&M2=69

Subject: [TS-850_450_690] TS 850 antenna tuner

does anyone know if the internal antenna tuner for the TS850 and TS870

are the same .Is the installation of the tuner difficult? I have a

TS850s and I have located a TS870 tuner and would like to install it in

the 850S .I do not have the manual. 73 MIKE

Topic: 3424 Message: 5668

Thanks guys for all the info. I have had the same problem: NO DISPLAY.
I replaced the C18 and the other 2 100mfd's. No joy.
I kept at it and read all lands. They were good. Still No joy.
I removed the caps and found that the feed thur was gone on the C18,
eatten away. The backside solder point was ok so when I soldered it in
it looked good but was not making contact. Adding fine wire wrap and
resoldering them back in: TS-850 JOY!!

Thanks guys for all your info. KD4BNM Mike.
Thanks again!! 73's

Hi All!

Anyone had a listing or the nomenclature used to identify the productions
date ranges of the TS-850S/AT's?

my TS850 does not accept the #95 INRAD even though the INRAD chart says its the right one.Problem is that the TS850 has 5 vertical pins on each side where the filter is supposed to plug in;however the filter has a recptacle for 5 on one side but only 3 on the other??Is it the wrong fiter or do I clip pins on the 850??

sounds like an error on inrads part, check their webpage and confirm the number (95???) ALL kenwood models plug in the same way as far as I know, the older style were solder in.

did you buy this new???

their website www.qth.com/inrad I think

Web page says filter soldered on custom PC boards. Is yours? I have
never used one of the filters but I understand they are plug and play.
Maybe Clif will come up and help us out here.

I believe you will need to clip the pins - It should state that in the directions! I remember
clipping them on mine - you should be able to download the directions from the Inrads site!

Clip the extra pins on the 850, one side only. Look at it 3 times
before you cut. I just recently had to replace one of those header
pins that was cut wrong. Kenwood doesn't sell the pins and I had to
raid a junker board for the part.

5676. Re: TS-850SAT 15M Distortion And No ALC

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-03-21 18:18:55 UTC
From: Clif
Topic: 5626 Message: 5676

Checking in late on the discussion as when it was active I did not have any 850's to look at and didn't remember seeing the problem.

I have 2 850SAT's here now, SN's 307XXX & 602XXX

Each requires more mike gain or carrier control on 15m to achieve full output but both will develop full output and full scale ALC without distortion. Comparing 15 and 20m shows the Mike gain to go up 1-1.5 divisions for full scale. Using a single 1kHz tone and measuring the distortion on the demodulated signal shows .6% Distortion on both bands at full scale ALC. On the 2-tone test using 300 and 2700 Hz as used to set the Car osc some rounding of the peaks is visible on a 'scope on 15m. Looking at a spectrum anayzler showed no change. I have not measured the loss thru the BPF on the RF unit but interestingly enough 160m requires the Car and Mike gain controls to have to be turned up to the same levels as 15m to achieve full scale ALC on CW and SSB.

Interesting. When I have more time I will measure the loss thru the BP filters.

Cliff,

I'm still waiting to hear from Bill, K0ZL, as he recently posted that he had a TS-850S on the bench for this problem. As for your observations, I had also noticed the same 160M conditions. My 2 tone tests also produced the rounding of the test pattern. Unfortunately, I do not have a spectrum analyzer so I am not really sure what is happening.

Clip the extra pins on the 850, one side only. Look at it 3 times
before you cut. I just recently had to replace one of those header
pins that was cut wrong. Kenwood doesn't sell the pins and I had to
raid a junker board for the part.

No big deal the board has 4 ground pins and 1 in/out pin. Cutting off
2 ground pins hurts nothing except appearance. The filter can't be
modified because of the size, it's larger than the Kenwood

5681. Problem with TS-450S receive

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-03-24 16:19:36 UTC
From: ron
Topic: 5681 Message: 5681

Lately my receive on my TS-450S is acting up. Some symptoms I notice are is that is seems a little weak. Another thing I notice is all the signals seem to have the same S reading. about a 20db reading. As if the AF is turned up but it isn't. If I turn the AF all the way up of course the S reading maxes out. Then I quicly turn the AF all the way down, the signal will read momentarily about an S9 and the volume will increase on the signal, then the S reading will slowly rise to about 20 and the volume of the signal will decrease. Does this sound like a capacitor problem and does anyone know what is most likely to cause this? Thank You

5686. CPU type noise?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-03-27 12:46:46 UTC
From: Barry
Topic: 5686 Message: 5686

Hi,

I recently bought a very nice 850, and changed the original battery that amazingly was not leaking. I had no problems during the battery swap, but over the last couple of days, there has been a big increase in CPU type noise. A lot of it is coming through the antenna, as disconnecting it cuts it way down, except for the really bad areas descibed below. Compared to my other receivers, the noise is obvious. There is no sensitivity problem, it hears well, just a lot of hash that makes the weaker stuff hard to hear under the whine..

It's not too bad, from the 6.575 area mentioned below on up, until you tune to 24 and it slowly increases to 25MHZ where the bandpass filter switches over, and it jumps up noticably and is all over the place, going up and down all the way to 30MHZ. It's NOT my PS, I hooked it up to a battery and it was the same. I checked all the plugs, and ribbon cables, and they look fine. I am pretty experienced with doing minor repairs and mods on Kenwood 450's and 850's, and I kind of think this is just a coincidence. It had a slight amount of this noise when I got it, but it's obnoxious now, and it's really bugging me, to put it mildly.

The noise increases tremendously when any of the IC's in the battery area are touched, touching the firmware IC causes a tremendous amount of hash.

If I tune around, there are freq ranges where turning the tuning knob makes a creaking noise and if turned slowly enough, makes a "tick" each tuning increment (1hz). One of these ranges starts at about 6.575 and gets louder until 6.585 where the tuning noise pops up. It fades away until 6.595 where it's almost gone. Other places this occurs is centered on 6.345, 6.190, and 6.060. In AM mode, it's VERY loud, in USB, and LSB, it's not as bad, except where it makes the creaking noise as described above.

Any ideas??

Thanks,

Barry N8PVX

Hi Peter,

I looked around all over and couldn't see anything loose anywhere, but
I suppose it wouldn't hurt to look again. It just seems odd that it
got worse about a day after the battery was done.

Thanks,

Barry

The noise is not on my 3 other recievers. At least until the 850 is turned on. The front panel area of the 850 seems to be the source of it. I can't figure out why it's doing it. It's the same when run off my PS or a battery.

Thanks,

Barry

Yes, but the noise is unchanged, regardless of the 850 being grounded
or not. The noise is coming from the front panel area of the 850, a
sniffer connected to one of my other radios shows this, the cause is
what I can't figure out.

Thanks,

Barry

Date: 2007-03-28 02:47:31 UTC
From: Barry
Topic: 5686 Message: 5693

The noise is coming from the TS850, my other receivers are quiet. The
do pick up major hash coming from the 850 front panel area.

Thanks,

Barry

Yes, but the noise is unchanged, regardless of the 850 being grounded
or not. The noise is coming from the front panel area of the 850, a
sniffer connected to one of my other radios shows this, the cause is
what I can't figure out.

Thanks,

Barry

Hi,
maybe in the process of exchanging the battery the vibrations
broke some ground connection? Maybe it's a good idea to remove all the
connectors and clean the contacts with some product...

just two cents...

I have had a similar problem- when touching the main tuning dial. Making a good electrical and rf earth cured the culpit

Barry <bumologist@...> wrote: The noise is not on my 3 other recievers. At least until the 850 is
turned on. The front panel area of the 850 seems to be the source of
it. I can't figure out why it's doing it. It's the same when run off
my PS or a battery.

Thanks,

Barry

Try to loosen and re-tighten all screws on the boards in the rig.I could be that there is some loose connections to ground. I hope you did the remote battery mod as it will make replacement a snap.

I'll bet it happens when you are receiving a strong signal and is OK with a
weak signal. If that is the case then it is normal.

Check this page out.
http://www.geocities.com/lfnca/450bat/450sat_battery.htm
I placed my battery close to the fan in my 850 doing basicly the same as this mod.

Good Luck

Barry and the 850 Group.
My 850 does exactly the same thing on the same freq's as Barry's and that's with no antenna and antenna shorted at rig so-239. My batt was changed out about a year ago - by the dealer...ouch!!! while doing some repairs. Never noticed this noise before either. Still there even if you press the SCAN function. Rig is factory original - no mods.
I'm located north of Toronto Canada so I don't think Barry and I are rx'g the same qrm.
Following the threads

Same noise on my 850, but only S1 on AM. Very unlikely to be common
external QRM unless the propagation conditions are very good between
NA and England :-)
When I got the rig it had the remote battery mod already fitted.
I suspect that the problem maybe bad earthing or decoupling in the
display area.

If D31 is bad you will have no RX in ANY mode, including FM. The check for D#! is to go to the RF board. About halfway back on the right side there are 2 points labeled RXB and TXB. RXB is Receive Bias and will be 8v in RX and 0v in TX. TXB is TX Bias and will be 8v in TX and 0v in RX.. Check those 2 points for proper operation. If D31 is bad then the RXB line will be appx 1-2v. TXB will be correct, 0 in RX and 8v in TX.

5778. Re: CPU type noise?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-03-29 19:04:46 UTC
From: Barry
Topic: 5686 Message: 5778

Hi Stewart,

This group is having serious issues, but I'll try..

I'm beginning to wonder if one or more of the electrolytic caps on the board where the batt is on are bad, and maybe me touching them caused the problem. I'm thinking since they are like 10 years old, and only 16 volts, I probably should change them out. Won't cost much to do it.

If it works, great, if not, I needed something to do anyway at work at 3AM.

Thanks,

Barry

5779. Re: CPU type noise?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-03-29 19:10:31 UTC
From: Barry
Topic: 5686 Message: 5779

Hi Roland,

I tried that a couple of days ago, and unplugged and reseated all the coax interconnects and got nothing. It actually seems to be getting slightly worse. I didn't do the remote battery, I put a holder in place on the board, and I did a test replacement on it, just taking the top cover off and was able to do it in a few seconds.

I'm liking the electrolytic caps on the board more and more.

Thanks,

Barry

I use a D104 that seem to work. Lots of AUDIO!

Picture posted under TS850 D31. This is a late model board with 2
diodes instead of 1. This is the bottom of the board under the ATT relays.

Topic: 5686 Message: 5782

Hi Tom,

No, I don't think we are picking up the same QRM!

This is what I've done so far, with no luck:

Reseated cables, coax and other interconnects.
Radio has same problem on PS or battery.
Grounding doesn't affect it at all.
Shorted antenna input, and it's still there, very noticable all over
due to lack of noise/signal to cover it up.
Resoldered the battery holder (I had the board loose, so why not?)
Reseated the socketed CPU.

Nothing.

The handling of the board, seems to be the cause, as far as I can
tell. maybe a cap didn't like being touched and died..

I'm going to change all the caps on the board, won't cost much to try,
and if it works..yippee!

Thanks,

Barry

Hallo!

I have a Kenwood TS-50 tranceiver in the shack and was wondering if there are any differences between the TS-50 and the TS-50S tranceiver. The reason for asking is that I tried to connect the AT-50 antenna tuner to my TS-50, and it would not work. Are there any mods I have to do to my TS-50 or??

5786. TS-450SAT CAT Interface.

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-01 16:27:18 UTC

Topic: 5786 Message: 5786

Hello.
As a totally new owner and user of the TS-450 SAT transceiver and member of this group may I ask what is no doubt a simple and very basic question please.

I would like to put my TS-450 under computer control,however I am not sure that the radio will support computer control without adding additional components !! My radio does have a 6 pin din plug on the side of the radio which is meant for the CAT interface !!.

The interface I am interested in is made here in the UK by Neil G4ZLP his web site is www.g4zlp.co.uk clicking on the Kenwood cat link will take persons to the appropriate page on the site - clicking on the more info link then gives more information on additional components for the various Kenwood radios that needs additional components fitting !! The TS-450 is not listed in the list !! However to be sure I would be ok before ordering the interface I mailed Neil direct to ask re the additional components I received a reply back a short while saying he was not sure if the radio needed the additional components hence the reason for this mail.

The handbook / manual does refer to computer control but does not give any set up advice e.g. Baud rate / parity etc.

The serial number of my radio is 40700039.

Any advice will be more than welcome.

Thank You in Advance.

73s.

Terry.

Hi Terry

I am using one of Neil's interfaces on my TS-450SAT and it works great (actually I have 3 of them for 2 '450's and a Yaesu FT-840). I got the one with the serial port plug on it. It just plugs into the side of the '450,, no extra goodies to buy.

The settings are 4800, 8, n, 2, handshake, handshake. I use mine with N1MM Logger and also with Ham Radio Deluxe. Neil also has great customer service. 73

Hi Terry,

Other than the interface you don't need any other hardware for the 450/690. They are the same except for 6 meters on the 690. I use the settings for the TS-950 if the software doesn't specifically have the 450 or 690. Works great.

Hello.thanks for the replies re my query on computer controlling the TS-450S
I have now placed the order with Neil,yes he is a great guy to deal with I
have interfaces from him for both my FT-840 and the FT897 with one for the
Icom range of radios.

As you say his customer support is superb - delivery time is usually very
good as well.

Again many thanks for your help.

5790. TS450S AutoTuner Problems

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-02 02:01:26 UTC
From: yb2ecg
Topic: 5790 Message: 5790

Dear forums,

I've been searching the post-archive about TS450S Autotuner problem
but could not find.

I always use my autotuner; a few weeks ago when running BARTG RTTY
suddenly the SWR rise up and the power decreased.
Soon I stop the transmision and check the antenna with analyzer; it
stil OK (I'm using tribander and my rotary dipole); I try using
another antenna (I've checked the antenna before with the analyzer)
but the AT stil have the problems.
I've also tried with the manual tuning but could not reduce the SWR!

Any suggestion and recomendation will be much appreciated.

Regards,
YB2ECG, Jon

5791. TS850 CPU type noise...SOLVED!!

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-02 03:35:00 UTC
From: Barry
Topic: 5791 Message: 5791

Well, it's over! It appears that the 850 must have been sitting a while, or the 16V caps Kenwood used just gave up coincidentally with my replacing the battery. I think 16V caps on a 13.8V radio is kind of cutting it too close.

I ordered all the caps for the digital board from Digi-Key and they came in two days, cost was like 12 bucks.

I took the digital board out completely, and gave it a look over before I started yanking out the caps, and I found one cracked, and one funny looking solder joint on the board, so I hit those, and resoldered the battery holder, just out of paranoia, my soldering is pretty good after all these years. The cracked joint was on a plug, but it didn't seem to affect the receiver at all, so that wasn't a cause of this issue.

There are 3 47uf caps right next to a heat sink on the right hand side of the board, and one was puffed up a little. Not like it was really noticable unless you look at it really closely. When I was pulling on the first of the three, it came apart. The guts just pulled out. Second one did the same thing, the third seemed ok, but I crushed it and it was full of powder inside, it was dry as a desert. These 3 caps are in a little corner when the radio is all put together and there's not much, if any airflow over them, and that heatsink is too hot to touch with the front panel swung down, let alone when it's closed up. There are two regulators on that heatsink, and it seems like an odd place to put them, but that's Kenwood. I'm guessing these 3 were the main cause of the problem, but I found a couple of the 100uf caps that came apart when just slightly pulled or pushed on, they were dryed up too.

So, with all the electrolytics on the Digital Board replaced, it was time to fire it up.

Six megs was clean! Nice. I did the repairs at work, a horrible place for HF RFI, but I tuned in several hams on 75 meters with a hunk of wire shoved into the SO-239 and also found a few SW stations on 40 meters.

A quick check at home shows that the whine is gone everywhere but a couple of places and those places it's still there are very weak, anything readable would cover it up. The other 850s I played with had it too, so I guess it's normal. No more "door creak" noise and the nice normal HF background hiss is a nice change on on the freqs where S7 on up worth of CPU grind was there previously.

SSB audio is fantastic now, it was good before, but is a lot better now. It's a keeper. Thanks to everyone for your suggestions.

Barry.

5792. '850S vco2 question

I recently and suddenly had the all dot display/UL code problem come up. I measured the vco2 voltage at TP2 and it read 7.9, but adjusting TC1 wouldn't change the voltage. I changed out TC1 with a 3-10pf cap, voltage now reads 8.1, however adjusting the cap again doesn't change the voltage. Why am I not able to adjust the voltage with TC1? Any ideas for plan B?

Barry,

Great job.

Since you've already done this, could you provide a parts list with schematic part #'s, the Digi-Key part #'s for this board?

It sounds like many of us need to get busy with the digital board… and perhaps the rest of the radio.

Congrats and thanks so much!

Steve, NL7W

5796. Ran an experiment on the TS-850 processor, wonder if someone else could do so

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-02 20:19:57 UTC
From: Dave
Topic: 5796 Message: 5796

I ran an experiment last night, to check on a theory I have about the speech processor in the TS-850.

Here's the setup:

* Set the PWR knob full clockwise, basically full 100W output.
* Mode can be USB or LSB, doesn't matter.
* Rig should be connected to a dummy load, or an antenna with low SWR, or use the tuner. Best to do this on a band that's closed...you'll make some noise doing this.
* Turn the PROC knob fully counter-clockwise.
* Turn the PROC ON
* Start with the MIC (gain) all the way counter-clockwise

Now, press the PTT...zero output power, as you would expect. Start advancing the MIC (gain) control and you will see the RF output power climb. You're transmitting broadband noise. On mine, I can get it up to about 70 watts shown on the front panel meter, at which point, it's a very wide noise, centered on the dial frequency.

My theory is that the speech processor is a very high-gain circuit, so it's inherently noisy. When you turn on the processor, it is inserted between the microphone and the MIC control. The PROC control, when the processor is enabled, becomes the new "mic gain" function and the radio is dependent on the MIC pot having been set correctly before the processor is enabled.

The "high boost" is really designed to work in conjunction with the processor...my experiments suggest that it's optimized for 10dB of compression. I often run with the high boost enabled, and the processor turned on, and until I mention that I'm running processing, nobody notices.

Anyway, I'd be curious if someone else would try that test - PROC gain all the way down, turn on PROC and see if you get broad noise out of the rig as you advance the MIC control.

In my case, I can hear it in the monitor, if I have that enabled.

TNX & 73,

Dave W8NF

Hi Dave;
Wow, I saw this the other night when I was switching mics around.
With the MC-60 I have the problem as you say.
With the orignal mic for the unit, no problems.
Go figure??
Hope this helps some.
Thanks for the info. Now I know.

The MC-60 is an amplified desk microphone. I suspect the gain of the microphone preamp + the gain of the compressor is responsible for the wideband noise. I use my microphone so infrequently I've not noticed this condition. I will check this evening after I get home from our club meeting.

I've often wondered the proper way to adjust the microphone gain and then the compressor, with or without a preamplified microphone.

Then you saw something completely different. What I saw was noise
from the processor circuits. I could unplug the mic, key the radio
with the "SEND" button and get the same effect.

With the processor engaged, the "PROC" knob becomes the mic gain...and
the experiment is done with that knob turned all the way down. No
signal from the mic is required.

I'll have to run the experiment again to make sure I'm properly describing it. But the point is that no microphone signal is required in order to create this nearly full power output. It seems the noise is created by the processor circuit. It's not a failure, I don't think - the setting of the MIC control (which sits between the processor and the SSB modulator, when you have the processor turned on) to create the excess power is preposterously high, way above where you'd set it normally.

Here's my procedure for setting up the processor. When I do this, stations I'm in QSO with report that it sounds like I turned on an amplifier - does not sound processed.

First, set up with the processor OFF...whatever other settings you have, ensure that the readings of the ALC meter are "just barely". The TS-850 generates a lot of splatter if you allow too much ALC action.

Now, turn on the processor, switch the meter over so that it's telling you how many dB of compression. Adjust the PROC knob on transmit until you get 10dB of compression...maybe 15dB on voice peaks. This should be the end of it, but just to make sure, switch the meter back to ALC, and make sure the ALC reading is still "barely off of zero". If it's not, turn down the MIC knob just a hair until the ALC is barely moving again. With the processor enabled, the ALC action is a bit steadier.

That gives you a signal that's a bit more commanding, without sounding shrill or processed.

5801. TUNING KNOB CRACKLING SOUND

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-03 01:25:44 UTC
From: mintaka capella
Topic: 5801 Message: 5801

Hello everybody!

I have a Kenwood TS 850S rig which I find a little annoying lately. The problem with it is the mild crackling sound that could be heard whenever the main frequency tuning knob is turned and the sound stops when the knob is at rest. The crackle is heard on all ham bands. Rather odd this problem is and I am at a lost as to how to rectify it. Would appreciate suggestions to solve it. Regards

Hi again;
Just a note, I did run it without the amp on. I haven't had the chance
to test that part yet. Just bought it 2 weeks ago and was still
compareing the two.

5803. TS850 CPU type noise...SOLVED!!

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-03 12:47:50 UTC

Topic: 5791 Message: 5803

Ok, since you asked for them:

These are the radio part numbers, and the digi-key parts numbers for them. This is for the Digital Board only...

C134
C135
C138
C139
These are all 47uf caps, and I used Digi-key part number:

P1179-ND

I made a mistake in my last post, there are 4 of these caps near the heat sink.

C152
C172
C181
C190
C196
C198
C208
C288
C291
C305

These are all 100uf, and I used Digi-Key part number:

P1180-ND

C195 is a 10uf, and I used Digi-Key part number:

P1176-ND

This really isn't a hard job, there are SMT components nearby, but using a small soldering iron, you should have no trouble changing the caps out right next to them. The caps are pulled very tightly to the PC board, and the leads are folded back against the pads. I found the best way to remove them was to use a desoldering iron, and to heat the joint and just push the cap until one lead was out, and then heat the other joint, and pull it out. My desoldering iron cleaned the holes out very nicely and it was easy after that point. Label the cables before you unplug them, but it's really hard to plug them back in incorrectly. Be careful on the heat, I did have one pad come loose,

but it wasn't a problem.

Good Luck.

Barry

While I had an 850 on the bench this afternoon I ran the test you describe.

I got less than 1/2w out with mike gain AND proc all the way up. Turn down either just a bit and nothing. Sounds like there is a problem with your carrier balance. This was with NOTHING connected to the mike jack.

I get those results with the processor turned off...about 1/2 watt of noise output.

I've looked at mine on a spectrum analyzer...carrier power is about 10mW, 70dB below 100 watts, so that's well in spec. What I see on the spectrum analyzer is about a 2.7kHz wide noise pedestal, consistent with feeding white noise through an SSB transmit filter.

Was your test done with proc on or off?

I also did mine now on several bands...10 meters is the lowest power out in the test, about five watts. On 20 meters and below, I can clip the final amp.

It's a matter of curiosity only...having both knobs cranked up is not at all a recommended operating condition. For correct operation on mine with the supplied handheld microphone, I run the mic gain and proc knobs both at about 9 o'clock, and I have a rather quiet voice.

RF Parts sells transistors, etc but are not Kenwood parts distributors.

Try www.pacparts.com or www.kenwoodparts.com Those are the Kenwood parts distributors. PacParts shows them to be out of stock but not discontinued which means they are on order. Kenwoodparts show them and may have them in stock, give them a call. They don't indicate stock on the website. Put in an order and wait, it usually takes 2-3 weeks unless you timed it wrong and they just ran out which means it can take up to 6 weeks.

Pacparts is in Ca and Kenwood Parts (East Coast Transistor is on the other coast. Pick whichever...

Doyle,

That appears to be the "TRX" module. If it's got a visible overheated transistor, you need to find the cause, or it will happen again.

The cause is a short-circuit on the TX8 line to ground somewhere. The most common short, is when capacitor C1 on the CAR board leaks. I mean, physically - the goo oozes out of it, etching away at the PC board underneath, causing a short circuit to ground. The CAR board is the one with the four large DDS chips on it, under a stack of shields on the left top of the radio.

I fixed mine by removing C1, scraping off the charred board, filling the resulting hole with epoxy, and soldering on a wire to replace the now-scraped-off trace.

You can find other hams' experiences doing the same repair with a simple Google search for the words C1 CAR TS-850SAT.

I got my new TRX board from PacParts...just place the order online with a credit card and all will be well.

Hope this is useful.

73,

Dave W8NF

Hey Mike,

I've run the following on my TS-850Sat for years with great success:

Shure 522 -- an outstanding wide frequency response mic with
unidirectional characteristics
Shure 444D -- an excellent mic with more omnidirectional characteristics
-- picks up more background noise with the processor on.

I'm finding 522s on eBay for excellent prices, and have picked up two
like new units for 5 to 20 bucks.

They will last a lifetime... and sound great!

I haven't been able to find anything on this at all. I found his page,
but there is nothing about the TS850 on it. I ordered the caps for the
carrier board and the RF board too, I'm going to replace all the 16
volt caps. It was a crazy thing to use them in the first place.

Thanks,

Barry

OK, I had no receive audio and performed test where jumper wire between pin 7 to pin 10 while in RX mode is used to see if audio returns and it did. I shall check the CAR board caps as well. Thank you all for the valuable information.

Dumb questions about microphones...

I used a desk mic with my Drake B-line, and when I sold that and got the '850, I adapted it for the '850..impedance and level conversion. I get good audio reports from it.

However, I find I almost never use the desk mic, but instead, use the handheld mic or a headset/boom mic combination. I'm a tad short on desk space, and don't care to have the desk mic taking up a lot of space, also I found when using the desk mic, I most often picked it up and held it. I guess when speaking into a microphone, I'm not keen on being glued to sitting in one spot. I find the headset/boom microphone to be the handiest, and that's what I use most often. I just use a $2 PC-style headset/boom mic, to which I added a 9V battery, coupling cap and two bias resistors, since the mic needs DC to power it. I get "great audio" reports with that microphone as well.

If you're using a desk mic, do you leave it sitting on the desk, or do you find yourself holding it in your hand a lot anyway?

From: mdmalley
Topic: 5820 Message: 5820

my TS850 intermittently drops output to about 50 watts and the swr increases drastically. the problem is not the antenna or AT.At times the output stays ok and smr is normal,then suddenly the problem ocurrs.Is it likely a failing final transiter??thanks for any suggestions and where is a good place to send it for repair. MIKE

5821. Control my TS-450SAT transmitter from Amateur Contact Log ?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-06 20:02:45 UTC
From: ve9xyz
Topic: 5821 Message: 5821

I've been using Amateur Contact Log 3.0 and am really impressed. I am using the MAX232 based interface for my Kenwood TS-450 (see plans in the Files section)

One feature that I've been reading about sounds very impressive - using my station PC's function keys to key my HF transceiver & broadcast a pre-recorded station ID or contest call. Would save me a lot of voice (I was about to build my own hardware solution to do this!)

So I read up "Phone Wav Selections" but am not sure about what is meant in the set-up screen to get my transmitter to key. Do I interface a simple relay that look for a logic state on the serial port's DTR or RTS pins, or is this done with a serial command that the Kenwood must interpret? Maybe there's a pin in the parallel printer port I'm supposed to steal?

I've been experimenting with Ham Radio Deluxe and its embeded PSK31 application and it seems to be able to key the TS-450 just fine but I'm not sure how that is actually keying up the transmitter, but its definitely doing so thru the CAT interface I built.

Perhaps somebody who has some experience with this can offer some advice or detailed instruction?

Sorry if this has already been answered, but I couldn't find some help in my web searches.

73 and Happy Easter,

Kevin VE9-XYZ

Terry I built my own interface just last year and published the plans for that little project in the files section of this group.

I use Ham Radio Deluxe, Amateur Contact Log, and Kenwood Smart Memory Manager with my TS-450SAT and have had excellent results. Sure makes the hobby easy to work with.

I see that you bought an interface, and it's on its way. Drop a message if you'd like any further help. QRZ.com has my coordinates.

Most likely it's the -6v DC/DC converter board (X59-1100-00). Notes on it are in the files section under 850 Notes. It's a long letter and it's about halfway down. It's not a hard fix if you want to do it yourself...

I would highly recommend Clif at Avvid Electronics if you don't want to fix it yourself. He has worked on two of my radios. I can't say enough good things about him. Competent, good comms and reasonable prices. Plus, VERY good reputation of many years.

This sound exactly like the DC/DC board or the X59-1100-00. Mine 850
has been repaired for this same problem. I keep two extra board on
hand.

From: Marty Bluhm
Topic: 5837 Message: 5837

Happy Easter All!

Well, I've got a strange one that has just started happening.
When I try to enter a freq on the keypad, it reverts to the previous freq.
For example:

Freq 21125
Ent
14087.00, it reverts back to 21125.

If I try to enter 15000.00, it reverts back to 12.(blank)

if I try to enter 16000.00, it reverts to 13000.00 and goes into the scan mode.

I've done a master reset (rx-a down while turning on the radio, with no success.

If I right click on a 14khz freq off the cluster, it goes right to it. If I try and enter another 14khz freq on the keypad, it reverts back to freq taken from the cluster i.e. 14.268.70, try to enter 14.087.00 from the keypad, you can enter the first two digits and it reverts back to 14.268.70.

The problem seems to be in the row containing the 4,5 and 6 with the rec-1, rec-2 and rec-3. I can enter freqs via the keypad with numbers in the first and last row (1,2,3 and 7,8,9)

Also, if I go to VFO B receivemy 1mh icon comes on and doesnt not change in the 1mhz range, if I go to vfo b tx the flock comes on and locks the display.

Anybody else experience this. Hopefully, there is a switch or something that can be reset.

Thanks and HELP!!! Just got the radio in Dec for Christmas.

5838. TS-850 lost RX?

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-09 13:40:04 UTC
From: Mike
Topic: 5838 Message: 5838

Turned the TS-850 on this morning and started listening around the bands. Was listening to a some weak stations on 75m when the RX quit. I checked and I have 100% TX but no RX on any band. Turned rig off and let it sit for a minute then turned back on and had RX for about 5 minutes then lost RX again. Now it stays off.I noticed the "On Air" light is barely lit but both the radio meter and the meter in my tuner show no power out. Un hooked the mic. but that made no difference. Any ideas ?? I switched to the FT-990 back up rig and already miss the 850 :-(. 73 , Mike

Do you hit the enter button first? To change freqs you must hit the enter button first, then key in the desired freq, then hit enter again. That works for me.

Which rig are you talkking about? On the TS-850S, you push "Enter", then push the digits of your frequency and when you've entered enough digits it goes to that frequency (if it's working right). I've never had to push "Enter" again after I started entering the numbers. If you want to go to a lower frequency, such as 500 kHz, you have to push "0050000" to get there.

It could be D31 or Q15 depends. Do you have any noise at all out the speaker?? If not D31.

Remove the bottom cover. With the radio upside down and VFO towards you the RF unit is on the left. Midway back on the right side of the RF unit are some marked test points. Locate the one marked RXB and measure the voltage on it. It should about 8v. If it is 1-2v then D31 is bad. Ths is most likely with the dim TX light. In the photos I have posted a picture of where it is (bottom of the RF unit). Replace it with a MI204, not the SM diode.

Clif,
I've followed your posted messages since I joined the group and found them very interesting and informative.

Have you read my two messages concerning my 850S keypad, fm/am, vfo b and 1mh and flock going south?

Do you have any ideas on the cause and what it will take o fix it?

If you want to reply off-line, my email is w8aks@...

Thanks and 73

I don't have any definitive ideas. Were I to guess I would start by looking at the battery. If it has leaked and damaged traces all bets are off as to what the radio will do. There are several data lines that run under the battery which usually cause the problems.

The keypad itself is a simple matrix with very little to go wrong, push this button and it shorts these 2 lines type of deal.

Hi,

I'm looking at buying an 850SAT. I spoke to the owner who told me that the measured power output was 145 Watts on a dummy load. I thought the radio was rated up to 100 Watts. I suppose it's possible that running 145 watts may cause problems, has anyone else on this group encountered any problems with 850 at these power levels??

Thanks for any info!

Andrew

I don't have the info in front of me, but actually you can adjust VR whatever on whatever board and it will easily do 145+ watts, done it. Probably ALC but I don't recall. Why anyone would run a rig that hard escapes me but I was just playing...No junk meter either... I wouldn't advise you to run your '850 that hard but it will handle it most of the time.

Hi, when I buy mine TS-850 the power was around 95W
on all bands. I was adjust output power to 120W.
It was meassuerd with the Bird wattmeter. Yes,
the power could go even higher, but I think that
more than 120W is just to much for the output stage.
If you need more buy an amplifier. If the seller's
850 is in good shape and if still deliver the power,
buy it and decrease the trimpot down.

Good luck

Thanks for the replies so far.

I think I'll take a look at the rig anyway and if I do buy it I'll reset it to 100w. If the rig has been regularly used at 145w what kind of problems should I look out for? Are there any tell tale signs that would indicate a problem with the rig? It's currently in use only on 11m, maybe that should be fair warning to stay clear!

Thanks again,
Andrew

In the FWIW dept. I had an 850 on the bench the other day. It was set to 135w output. Just for grins I checked for distortion. When the radio developed ALC, just starting, at this power setting the 2-tone audio was obviously distorted. When set back to 100w there was no distortion until the ALC went off scale, not fullscale, off the right side of the scale.

May I make one suggestion. Check the battery inside. If you do buy it, change it out NOW!!!.
I bought my 850 in Dec and love it. It is now on its way to the Kenwood Service Center. The battery leaked onto the traces and part of my front panel is inoperative. Reading the 850 pages, this is a common problem. So beware.

Before everyone gets all excited about cranking up their TS-850 to a kw, THINK about what it is going to do to the 3rd and 5th order distortion products. Yes, maybe it will run at that level without blowing up but most bi-polar devices increase in IMD dramtically when pushed. Inject a two tone generator into the mic input and measure the distortion products on a spectrum analyzer at 100w, then increase it an watch. If you don't have this equipment, DON'T even try it.

There isn't really a lot to be gained from increasing the power from 100 to 150 watts in terms of S-units. It WILL produce additional distortion, as has been noted.

I've always held the philosophy that if I need more power I'll just get an amp big enough to make a real difference.

JUST THINK DECIBEL: increasing to 150W will only drive you to problems giving less than 2dB of gain. Furthermore remember that amplifiers usualy require 60 to 100 watts of input power. Sending more can lead you to tube (or transistor) destruction. Stay at regular power, DO NOT INCREASE OUTPUT POWER.

Hi,

I have a TS 450 that has the opposite problem. It's power out is 85 watts on all bands. I looked at the service manual and could not find any direct way to raise the power back to the 100 watts. Yes I know it there but I couldn't find it. Will anyone tell me the correct pot to turn? Even more helpful would be where this whole subject is discussed in the service manual. Many Thanks, K4LLQ

Ok, with such low power (if your measuring instrument is trusty) do
you have a BIG ALC deviation? If not, it means that total transmiting
gain is below specifications, if yes, this means that you just have
to open the tap a bit. The involved VR is VR7. Located UNDER the
radio where the board exhibits a metal shied. A hole in the shield is
provided to acces the adjustable resistor. MAKE SURE THAT YOU HAVE
THE PROPER SCREWDRIVER AND A RELIABLE METER, as well as a powerfull
enough power-supply. On my personal radio, the lower transmiting gain
(thus requiering the most of CAR position) is obtained on 15 meters.
I even do not have any ALC with CAR fully clockwise, if power voltage
drops below 12V. Everithing goes fine if voltage is 13.8V. I guess
this will vary with other radios.
After making new adjustment, MAKE SURE THAT YOU HAVE ALC DEVIATION on

all bands, thus making output power "under control" and not free run.
73's from Joss, F6IQA

Clif's note. He has a 450 not an 850. The alignment is on pg 124 of the service manual, step 8. It's VR15 (right rear of the IF unit)

Do it yourself. The hardest part will be finding a new relay, Kenwood discontinued them over 10 years ago. Since you have another radio neutralizing the tubes is simple. The tubes and relays (yep, there are 2) all plug in by the way.

Yes, the 850S can be adjusted for this high power output level...

But, much above 100 watts, for which the rig was designed, caused much worse intermodulation distortion products -- something we do not want to do as amateurs. The 850's transmit intermod distortion products were/are not the best to begin with, I think around -28 dBm from the ARRL report of years ago. So, you'll be increasing the distortion products of an already poor intermod product level radio... not wise.

I would adjust for 100 to 110 watts -- no more. If you buy the radio, realign it to factory spec.

Thanks again for the comments! At least no-one has said avoid this rig even if it has been run at 150 watts! If I were to buy it I would definitely reset it to 100w, my main concern was if the radio had been abused how could I tell? I suppose one check would be to listen to the audio through the monitor and check to hear if the audio is 'clean'. Anyway, thanks again for the comments....!

Andrew

5868. TS-450S Backup battery replacement

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-14 19:20:01 UTC
From: w7smj
Topic: 5868 Message: 5868

All:

I just performed the battery replacement mod on my rig last night and found that there was no battery leakage and the old battery still produced 3.2 V.

I purchased my rig in Oct 1995 and the serial no is in the 603 range. I have been relatively inactive the last 11 years and rarely, if ever, used memories so this may have been a direct result of the battery's performance.

Anyway, I just wanted to pass on my results as another data point to add for anyone considering replacing the battery.

73,
Scott

5869. TS-850 Receive problem

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-15 00:11:05 UTC
From: lightsearch52
Topic: 5869 Message: 5869

My 850 has been a problem for a while. I replaced the DC to DC board and replaced the battery. While performing these I inspected the caps on the CAR board at that time and they were visually OK. It started a different problem now with no receive when turned on. With this I noticed the On Air light would be on about half brilliance. The rig was NOT transmitting, however. Reading in the group postings and elsewhere made me believe the TX board may be at fault. We just changed it this evening. Problem still exists. When the rig is off for some period and powered up, the On Air light is half brilliance. Keying the radio does cause it to transmit and the light go to full brilliance. After it is powered for a period of time, the Air light dims to almost out. At this point, there is an intermittent receive condition that may last from 5 seconds to a minute. All bands work during this time and the S Meter responds. During these periods the radio will transmit when keyed and work fine. Kerchunking the mike does not necessarily cause receive to return.
Do not find anything in my research, so I am asking the experts.

Hi Andrew,

You could propose a "try before you buy" scenario.
That would be good...

Topic: 1009 Message: 5871

I did, and I bought the radio! I'm very impressed by the very quiet
and sensitive RX and I've had very good reports with the rig so far.
One thing I will do in the coming days is to replace the battery, I'll
have to read the article again but I think I can use a CR2032 instead,
they just don't last as long...

Anyway, so far so good, I'm glad I joined this forum, there's a lot of
useful info to be found...!

Cheers,
Andrew EI3GSB

Congrats Andrew! Now to tell you the bad things that are usually kept secret... you now will be forced to get used to the "Great audio" reports and once you get hooked on the slope tunning you will be disappointed in the new high $$ rigs because they just wont do what the 850 does as easily. I've had a chance to play with both the Orion and a IC-7800 for a few hours each and I like the 850 better. 73 , Mike

What does the s-meter show when "no receive"?
Open the radio and measure the RXB and TXB lines when in no rx mode.
Readings???

SN of radio?? First 4 numbers fine...

I have for sale a Kenwood SP-23 external speaker which matches the TS450/690/570 series of radios, but will work with any radio. It works fine and comes with a cable to hook into the external speaker jack. The case has quite a few scratches on it, but the face of it looks fine. I am asking $35 plus shipping for it.

5882. TS-450S ACC3 Pinout

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-19 20:00:29 UTC
From: w7smj
Topic: 5882 Message: 5882

Hi,

I recently purchased an LDG K-OTT interface and would like to add a fuse to the interface to protect the radio. So far I have been unable to find the pinout of the ACC3 jack in any documentation.

I did run across a web page for adding an external fan that indicates pin 6 is +13.8V. Does anyone have the ACC3 pinout info they can provide or verify that pin 6 is the +13.8V lead?

Also, as long as I'm asking, in order to size the fuse appropriately does anyone know how much current you can safely draw from ACC3?

Thanks & 73,
Scott

Scott,

Looking at the connector from the back of the radio, pin 1,2,3 run across the top row left to right. Pin 4,5,6 run across the bottom row left to right. So pin 1 and 3, which are the two outside pins on the top are ground. Pin 6 in the bottom right is the +V pin. It should be good for a couple of amps at least.

Max

Hello All,

On the 850 the meter's moving bar, indicating output, changes
colour (changes to red) at about 75 W or there abouts.

I have not been able to locate in the manual what the meaning is
of this colour change. Any answers? Thanks in advance

73 Rein W6SZ.

Hi Rein!
The colour changes because the meter is also used as signal meter, and if the signal is greater than 9db the leds are red. No big deal.

Interesting...mine go red at 50 watts, not 75 watts. And mine appear
to be a vacuum-fluorescent display, not LEDs.

They could have let the VF bars be uni-color, and simply "reddened"
the meter scale above it.

I wish they'd used a genuine analog meter. I notice today's high
dollar rigs are going back to analog metering. My eyes always
preferred a moving needle. But overall, it's not a big deal...the
metering doesn't impact how great the RX is in these rigs!

There is also a TS850 listed on The ARRL's Radios On
Line right now for $550. Not sure if it is the SAT
model or not. If only they did 6m.

Hello All, got me an ts-850sat yesterday, and come to find out today that the antenna tuner will not tune antenna. Now i dont have the very best of antennas, but they are the same as i was running on my 450 about 6 months ago and had not problems with that rig. This one does try to tune, and then ends the tuning cycle with a number of beeps and it is not tuned at all. Wonder what could possibly be wrong with it, as i am new to the 850.
Hope to hear good comments and maybe a cure to this.

5894. VHF on TS-850SAT

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-04-24 15:06:21 UTC
From: Zack Widup
Topic: 1009 Message: 5894

I got the DEM TIB-850 kit (transverter interface specially designed to go with the 850) at Dayton last year and finally got around to building it last month. I'm building a transverter just to use at home on 6m with my 850. The other one I use was built primarily for portable use and the layout and design wasn't optimized for the 850.

Some people have gotten 850's cheap and taken the amp board out and replaced it with a transverter for a VHF band. Someone was selling a couple a few years ago set up for 6 and 2 meters. Unfortunately, they would have been a lot of work to restore to HF operation. With the DEM transverter interface I can do that by flipping a switch.

Zack,

I used to run a Yaesu FTV-700 2m transverter with mine. I installed two RCA jacks on the rear of the 850. You break the coaxial line that runs from the output of the driver going to the final amp. The output end of the driver stage goes to one plug and the input to the final goes to the other. I rigged a switch box to switch the transverter and RF path in and out depending on if I was using HF or 2m. Worked great, and you didn't have to remember to turn the RF down.

One possibility is that the previous owner had the
tuner set up for some unusual load.

Will the tuner settle down when you drive a 50 ohm
dummy load?

I once purchased a used TS-850S/AT where the tuner
worked OK except on 40m where it would not find a
match. My 40m antenna was resonant and exhibited
SWR close to 1:1.

I put the tuner into manual mode and was able to
drive the controls to get close to a match. The
tuner has operated fine since (in auto mode).

Not sure if this is your problem, but something
worth trying - if the tuner will not settle down
into a dummy load, use manual mode to drive it there.
Then try the real antenna again.

I hope tis helps.

Hi Everybody,
I have an EXP-14 from Hy-Gain with the 40 Mtr kit on it. I am going to buy a D3W rotateable dipole for 12-17-30 Mtrs.
My question is this :-
I am going to put the D3W like 3 feet up of the EXP-14.
How can I install the D3W ? on the EXP-14 driven element (zero degrees) or on the boom (plus 90 degrees). Hope you understand.
Thank you for any help. I am just asking cause I think that someone here allready passed from this situation. Also I'm afraid of the SWR and no good performance of the two antennas.

For Dave VE3WEJ:
this is what is going on. It acted up the first part of the month, so I drove to Va Beach from WV and delivered it to Kenwood service center. Stayed with my kids and got a call the next day that they could find nothing wrong with it. Picked it up and brought it home. Worked fine until Sat morning. Turned in on and tried to punch 14243 to hunt submarines and the same thing as below started again.
Driving me crazy. I've reseted the micro numerous times, disconnected power, checked the power supply voltage (13.91 volts). Only thing I havent done is pop the cover or bounce it off the walls. (That is next, 3 pointer into the dumpster). Only thing, XYL says NO MORE RADIO'S. So I guess that ended that discussion.

Hopefully, I can get some ideas from the group or a new board.

73
Marty
W8AKS
Well, I've got a strange one that has just started happening.
When I try to enter a freq on the keypad, it reverts to the previous freq.
For example:

Freq 21125
Ent
14087.00, it reverts back to 21125.

If I try to enter 15000.00, it reverts back to 12.(blank)

if I try to enter 16000.00, it reverts to 13000.00 and goes into the scan mode.

I've done a master reset (rx-a down while turning on the radio, with no success. Also A=B while turning on the radio. Also no success. According to Steve at Kenwood Service Center that is all they did.

If I right click on a 14khz freq off the cluster, it goes right to it. If I try and enter another 14khz freq on the keypad, it reverts back to freq taken from the cluster i.e. 14.268.70, try to enter 14.087.00 from the keypad, you can enter the first two digits and it reverts back to 14.268.70.

The problem seems to be in the row containing the 4,5 and 6 with the rec-1, rec-2 and rec-3. I can enter freqs via the keypad with numbers in the first and last row (1,2,3 and 7,8,9)

Also, if I go to VFO B receivemy 1mh icon comes on and doesnt not change in the 1mhz range, if I go to vfo b tx the flock comes on and locks the display.

Going to Vfo B TX, I get the F.Lock with the tuning locked as supposed to be.

In addition to the other key problems, I found my fm/am does not work at all. Pressing this button give me the quick memo feature with channel 1 displayed.

Well, By reading the manual a little deeper and playing, all is not lost.
With BS7H on the air, I was afraid spilt ops were impossible. Not true. Set
up Receive on VFO A and Input TX freq into Mem 1 and put VFO B into mem.
The spilt indicator is up and it keys spilt operation, so all is not lost.
At least I can operate until I can make complete repairs.

Passing this along for general information.

I dont see you hittting enter after you actually enter the freq, only before..... (or is this an oversight)

enter allows you to type the frequency, but you must hit enter again to "make it so" or make sure you add all ending zeros....

Subject: RE: [TS-850_450_690] Looking For a Kenwood Board

For Dave VE3WEJ:
this is what is going on. It acted up the first part of the month, so I drove to Va Beach from WV and delivered it to Kenwood service center. Stayed with my kids and got a call the next day that they could find nothing wrong with it. Picked it up and brought it home. Worked fine until Sat morning. Turned in on and tried to punch 14243 to hunt submarines and the same thing as below started again.
Driving me crazy. I've reseted the micro numerous times, disconnected power, checked the power supply voltage (13.91 volts). Only thing I havent done is pop the cover or bounce it off the walls. (That is next, 3 pointer into the dumpster). Only thing, XYL says NO MORE RADIO'S. So I guess that ended that discussion.

Hopefully, I can get some ideas from the group or a new board.

Marty
W8AKS
Well, I've got a strange one that has just started happening.
When I try to enter a freq on the keypad, it reverts to the previous freq.
For example:

Freq 21125
Ent
14087.00, it reverts back to 21125.

If I try to enter 15000.00, it reverts back to 12.(blank)

if I try to enter 16000.00, it reverts to 13000.00 and goes into the scan mode.

I've done a master reset (rx-a down while turning on the radio, with no success. Also A=B while turning on the radio. Also no success. According to

Steve at Kenwood Service Center that is all they did.

If I right click on a 14khz freq off the cluster, it goes right to it. If I try and enter another 14khz freq on the keypad, it reverts back to freq taken from the cluster i.e. 14.268.70, try to enter 14.087.00 from the keypad, you can enter the first two digits and it reverts back to 14.268.70.

The problem seems to be in the row containing the 4,5 and 6 with the rec-1, rec-2 and rec-3. I can enter freqs via the keypad with numbers in the first and last row (1,2,3 and 7,8,9)

Also, if I go to VFO B receivemy 1mh icon comes on and doesnt not change in the 1mhz range, if I go to vfo b tx the flock comes on and locks the display.
Going to Vfo B TX, I get the F.Lock with the tuning locked as supposed to be.

In addition to the other key problems, I found my fm/am does not work at all. Pressing this button give me the quick memo feature with channel 1 displayed.

I am trying to repair a ts850 with no tx. The tx b line that runs to several different boards to supply several circuits with voltage im assuming around 8 volts stayss low all the time.I would like to know where this is originated from. On the schematic i see its is connected to multiple points and even goes to the front control boards. But i cant see where it starts from Help.!!!!!!! Gary.

From: Marty Bluhm
Topic: 5898 Message: 5906

It never reaches that point. For instance, you are on 14024.00 and you want to go to 14185.00. Hit Enter (Brings up screen with dashes), put in 14 and immediately it goes back to 14024.00. If you are on 14024.00 and hit "Enter" then input 15, it comes up 12.___.__ , of course you can finish it out and add the zero's. . If you enter 125, it comes up 122 (the number right above it). Now if you enter 12 or 14 (it doesnt really matter) and input "6" as the third number you go to scan on mem chan 90 . Fun times are had by all.
i do a reset periodically hoping that the intermittent will reset it self; but I'm afraid I'm up the creek without the paddle.
Thanks for the suggestions, any and all are most welcome.

Most likely scenario;

C1 on the Car unit has leaked and shorted the TXB line. Clean up that mess first and hope it didn't get the TRX module.

If still no TXB then find the TRX module on the IF unit. It is a small circuit board mounted vertically at the back right of the IF. Look for X59-3680. Be careful there is a 3880 also. On the TRX module check these voltages;
Rx then TX
Pin-2 0 3.2 TX line
Pin-5 0 7.8 TXB
Pin-7 8 8 Common
Pin-10 8 0 RXB

If still no go Q152 on the board is fried. You can remove the board and replace the bad transistor and hope that's all there is or you can replace the board for less than $20. Me, I always just replace the board.

Keep us posted...

Clif

Exactly what happened on one of my old 850's. There was no TXB voltage anywhere. Upon inspecting the TRX board, one transistor had opened right up. Bought a new one from East Coast Transistor.

You are not going to believe this! Dave, I came in from outside and read your email. Thought I would try it. As I normally have been doing since last Sat, I hit the VFO B TX button and lo and behold the SPILT indicator came on instead of the F.Lock indicator. So I punched in an freq on the keyboard and it worked. So Things are back to normal for the moment. For how long is anybody's guess. I want to thank everybody that send suggestions, they were greatly appreciated. Really means a lot to have a great support group..

Thanks again, guys and 73

The problem seems to be in the row containing the 4,5 and 6 with the rec-1,
rec-2 and rec-3. I can enter freqs via the keypad with numbers in the first
and last row (1,2,3 and 7,8,9)

Also, if I go to VFO B receivemy 1mh icon comes on and doesnt not change in
the 1mhz range, if I go to vfo b tx the flock comes on and locks the display.
Going to Vfo B TX, I get the F.Lock with the tuning locked as supposed to be.

In addition to the other key problems, I found my fm/am does not work at all. Pressing this button give me the quick memo feature with channel 1 displayed.

I dont see you hittting enter after you actually enter the freq, only
before..... (or is this an oversight)

enter allows you to type the frequency, but you must hit enter again to
"make it so" or make sure you add all ending zeros....

Subject: RE: [TS-850_450_690] Looking For a Kenwood Board

For Dave VE3WEJ:
this is what is going on. It acted up the first part of the month, so I
drove to Va Beach from WV and delivered it to Kenwood service center.
Stayed
with my kids and got a call the next day that they could find nothing
wrong
with it. Picked it up and brought it home. Worked fine until Sat morning.
Turned in on and tried to punch 14243 to hunt submarines and the same
thing
as below started again.
Driving me crazy. I've reseted the micro numerous times, disconnected
power,
checked the power supply voltage (13.91 volts). Only thing I havent done
is
pop the cover or bounce it off the walls. (That is next, 3 pointer into
the
dumpster). Only thing, XYL says NO MORE RADIO'S. So I guess that ended
that
discussion.

Hopefully, I can get some ideas from the group or a new board.

73
Marty
W8AKS
Well, I've got a strange one that has just started happening.
When I try to enter a freq on the keypad, it reverts to the previous freq.
For example:

Freq 21125
Ent
14087.00, it reverts back to 21125.

If I try to enter 15000.00, it reverts back to 12.(blank)

if I try to enter 16000.00, it reverts to 13000.00 and goes into the scan
mode.

I've done a master reset (rx-a down while turning on the radio, with no
success. Also A=B while turning on the radio. Also no success. According
to
Steve at Kenwood Service Center that is all they did.

If I right click on a 14khz freq off the cluster, it goes right to it. If
I
try and enter another 14khz freq on the keypad, it reverts back to freq
taken from the cluster i.e. 14.268.70, try to enter 14.087.00 from the
keypad, you can enter the first two digits and it reverts back to
14.268.70.

The problem seems to be in the row containing the 4,5 and 6 with the
rec-1,
rec-2 and rec-3. I can enter freqs via the keypad with numbers in the
first
and last row (1,2,3 and 7,8,9)

Also, if I go to VFO B receivemy 1mh icon comes on and doesnt not change
in
the 1mhz range, if I go to vfo b tx the flock comes on and locks the
display.
Going to Vfo B TX, I get the F.Lock with the tuning locked as supposed to
be.

In addition to the other key problems, I found my fm/am does not work at
all. Pressing this button give me the quick memo feature with channel 1
displayed.

When I press the 6dB attenuator the received signal drops from 20 over to zero on the meter. Pressing the 12dB it only drops to 10 over. If I press the 6dB with it it again drops to zero. Possibly R2 on the RF unit is shorted to ground?

Well Dave, I think you hit the nail on the head. The radio went back to its old ways, shortly after I declared it solved (so what else is new :) However, tonight I was listening to 14185.00 (static) and thought I would try your suggestion. I had the 850 sitting on two small blocks of wood under the front feet. I cant get the feet to rotate down. Anyway, I removed the wood blocks and let the radio sit down on the desk and it started working properly. Not to get caught again, I've added/removed the blocks three times and each time it goes back and forth. Blocks under, radio goes down the tube. Blocks removed and back to normal. So your suggestion on the ribbon cable being pitched looks like a good one. Now to figger out how to get the top off and find the ribbon cable. Any ideas on that. I dont have the service manual. Would appreciate it. Dave, Cant thank you enough.

Marty,

Very odd that lifting the front of the radio up and down would cause
this. I would think it would be more likely some connector on the back
of the radio putting strain on the circuit board, but I can't see how
any of the connections back there would cause your symptoms. Ass for
the ribon cables, they are easy to spot. Wide flat thin connectors. No
wires are on them as they are thicks strips all coated in one package.
Pop the top cover off the radio and you will see many of them go to
the front digital board.

Subject: RE: [TS-850_450_690] Looking For a Kenwood Board

Well Dave, I think you hit the nail on the head. The radio went back to
its
old ways, shortly after I declared it solved (so what else is new :)
However, tonight I was listening to 14185.00 (static) and thought I would
try your suggestion. I had the 850 sitting on two small blocks of wood
under
the front feet. I cant get the feet to rotate down. Anyway, I removed the
wood blocks and let the radio sit down on the desk and it started working
properly. Not to get caught again, I've added/removed the blocks three
times
and each time it goes back and forth. Blocks under, radio goes down the
tube. Blocks removed and back to normal. So your suggestion on the ribbon
cable being pitched looks like a good one. Now to figger out how to get
the
top off and find the ribbon cable. Any ideas on that. I dont have the
service manual. Would appreciate it. Dave, Cant thank you enough.

You are not going to believe this! Dave, I came in from outside and read
your email. Thought I would try it. As I normally have been doing since
last
Sat, I hit the VFO B TX button and lo and behold the SPILT indicator came
on instead of the F.Lock indicator. So I punched in an freq on the
keyboard
and it worked. So Things are back to normal for the moment. For how long
is
anybody's guess. I want to thank everybody that send suggestions, they
were
greatly appreciated. Really means a lot to have a great support group..

Thanks again, guys and 73

It never reaches that point. For instance, you are on 14024.00 and you
want

to go to 14185.00. Hit Enter (Brings up screen with dashes), put in 14 and immediately it goes back to 14024.00. If you are on 14024.00 and hit "Enter"
then input 15, it comes up 12.___.__ , of course you can finish it out and add the zero's. . If you enter 125, it comes up 122 (the number right above
it). Now if you enter 12 or 14 (it doesnt really matter) and input "6" as the third number you go to scan on mem chan 90 . Fun times are had by all. i do a reset periodically hoping that the intermittent will reset it self; but I'm afraid I'm up the creek without the paddle.
Thanks for the suggestions, any and all are most welcome.

From: Paul Spiteri
Topic: 3747 Message: 5929

Hi Everybody,
I have an EXP-14 from Hy-Gain with the 40 Mtr kit on it. I am going to buy a D3W rotateable dipole for 12-17-30 Mtrs.
My question is this :-
I am going to put the D3W like 3 feet up of the EXP-14.
How can I install the D3W ? on the EXP-14 driven element (zero degrees) or on the boom (plus 90 degrees). Hope you understand.
Thank you for any help. I am just asking cause I think that someone here allready passed from this situation. Also I'm afraid of the SWR and no good performance of the two antennas.

Try posting to one of the antenna forums, you might get an answer there.

I have a D3W and a Force 12 C3E. I also have other VHF horizontal antennas on my mast which extends 18' out of my Rohn 45 tower. The C3E and the D3W are about 12' apart. If you can only separate the two by three feet, why not just turn it 90 degrees to be safe??????

BTW, the D3W plays VERY well, especially on 30 meters. I never thought being able to rotate a dipole would make such a difference. It blows away an inverted vee on 30 meter mounted just below it. There isn't much on the air I can't work with it.

5934. MC-60A Mic partss

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-05-09 05:14:11 UTC
From: bigfork04
Topic: 5934 Message: 5934

I need to replace the P.T.T. switches on my MC-60A mic base. There are three of them. Two for the P.T.T. button and one for the Lock button. Does anybody now where I can find some. I don't have a part number as there is not one on the schematic. Any help would be appreciated.

From: Joe
Topic: 5935 Message: 5935

Hi
some threads here have a workaround for problems caused by the 74LS145 chip. In my service manual 74LS145N is listed, my local parts dealer only have 74LS145P version, is the a difference. Would the P version also work in 850 SAT?

From: John
Topic: 5936 Message: 5936

Hello Group,

I have been working on a TS-450 that intermittently had very garbled or distorted RX audio. When I finally got it act up for awhile, I found the adjustment voltage for VCO2 was low (3.3 volts). After re-adjustment the problem went away, only to return about a week later. This radio has the later version DDS chips. Is the VCO2 trimmer cap the most likely suspect?? How does it act when it goes bad?? Thanks for any info.

That's exactly the way a bad trimmer acts. Just replace it with a nice ceramic one. The plastic ones didn't like the cleaning they got when the board was finished at the factory. Use a 10pf, Mouser has them for abt a buck...

Plastic trimmers have their place; I have learned the hard way that their place is NOT any sort of frequency-tuning or trimming circuit. They're fine for doublers and amps.

5941. Distorted RX audio

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-05-11 08:39:33 UTC
From: Jocelyn Navarro
Topic: 5941 Message: 5941

This is KNOWN problem: for your information, TX audio is ALSO distorted.The only way to solve it is to replace the variable capacitor by a piston type. This is a delicate operation but resolve the issue forever. I made this on my 850 (same problem and same solution) and now it works fine whatever temperature in the shack is.Before, adjusting VCO voltage will solve the problem only for a limited time (minutes) and temperature range.You can find additional information here:http://n6tr.jzap.com/vco2.jpghttp://n6tr.jzap.com/pll2.jpghttp://n6tr.jzap.com/850repair.html (on this page search for 'raspy signals on some bands')This is definitely the solution.73's fm Joss, F6IQA

http://cgi.ebay.com/Kenwood-TS-850SAT-IF-232C-SO-2-RM-1-3-Filters-More_W0QQitemZ150122262100QQihZ005QQcategoryZ40067QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

Up for bid is my beloved TS-850SAT. I recently purchased a FlexRadio SDR-1000 and the XYL says that I have no need for two HF rigs so this one must go!

It has only been in a non-smoking environment. The serial number is 30500399. It puts out a full 100 watts on all bands. Sorry for the poor picture of the meter showing this! The rig is in very nice condition and has been well cared for. The only the things wrong are the following; the door that goes over the DRU-2 has one of the two latches broken. However the door closes just fine. Unless you are able to find a Kenwood VS-2 voice synthesizer (and good luck finding one of those!) you will never have a need to open that door. There are a few small paint nicks on the top cover and a scratch. On the other hand the display is clear and bright. The rig is sold as is but is fully functional and works great. You will not be disappointed!

Equipment included in the auction are the following items:
Kenwood TS-850SAT HF rig. It has been modified to transmit on 60 metres.
Kenwood AT-850 internal antenna tuner unit - installed.
Kenwood DRU-2 internal digital recording unit voice memory unit - installed.
Kenwood SO-2 TCXO temperature compensated crystal oscillator - installed.
Kenwood RM-1 remote function keyboard & box.
Kenwood MC-43S hand held microphone.
Kenwood IF-232C computer interface unit. (Interface cable not included but I included 3 DIN plugs to make your own.)
Kenwood PG-2Z 2 metre DC power cable.
Kenwood YK-88C-1 500hz CW filter 8.83 MHz IF - installed.
Kenwood YG-455C-1 500hz CW filter 455 kHz IF ☐ installed..
Inrad 1.8kHz 8830 SSB filter 8.83 MHz IF (installed).
Heil Proset 5 with the HC-5 microphone element.
Heil AD-1-K adapter to connect the Proset 5 to the TS-850SAT.
Downeast Microwave TIB850 and cables - lets you easily connect a transverter to the rig http://www.downeastmicrowave.com/cat-frame.htm
Finger Dimple tuning aid
http://www.fingerdimple.com/_mgxroot/page_10730.html
After market heavy DC power cable with fuses and Kenwood DC

connector.
3 Kenwood 12 pin DIN plugs for wiring accessories part KE07-1351-05
2 6 pin DIN plugs for wiring the IF-232C
1 small DC plug to provide DC to the IF-232C

Literature included with the rig are the following items:
Kenwood original colour sales brochure (original, very rare item)
Kenwood manual in a binder (rough shape)
Kenwood manual copy with all foldouts!
Kenwood RM-1 manual
Kenwood IF-232 manual (copy)
Heil Proset manual
ARRL QST review of the TS-850
DEMI TIB850CK manual

The following modifications have been performed on the rig by Cliff at Avvid in 2003. http://www.avvid.com/ The receipt is included.
Replaced the memory battery.
Modified the rig for all band TX (60 metres!)
Installed the Kenwood SO-2 TCXO and calibrated the rig.
Performed the tuner modification.
Performed the noise blanker modification.
Performed the DRU-2 modification.
Performed the CW modification.
Added separate RX & TX connections (see rear photo closeup)
Aligned the rig.
If you would like to know more about the above modifications please see http://tk5ep.free.fr/tech/ts850/en/ts850_g.php

Last month the display started acting strange. I sent it once again to Cliff and he found that a cap on the CAR unit had gone bad. He replaced all of the SMD capacitors on the CAR unit. The receipt is included.

Like new, reprints by W7FG, complete with schematicsm etc, all the foldouts....detials at www.w7fg.com

Owners guide 10.00 plus 5.00 postage

Service Manual 25.00 plus 5.00

Both for 30.00 plus 5.00
reply direct please

5946. My TS-850 on ebay

Yahoo group: TS-850_450_690 (2006 — 2009)
Date: 2007-05-15 15:01:16 UTC
From: Zack
Topic: 5946 Message: 5946

The ebay item number is

150122262100

If you have any questions about the sale feel free to contact me.

5947. Antenna tuner problem

Yahoo group: TS-850_450_690 (2006 — 2009)

Topic: 5947 Message: 5947

Hi All

My TS-450SAT's antenna tuner seems to be kinda flaky. If I set it to manual, I can tune the antenna fine, but when I switch to automatic, it doesn't tune right. I can hear the motor turning and the SWR indicator goes up and down, but just never stops tuning. Any ideas where to start looking?
Thanks and 73

Tom,

First check your carrier level. Second, look through the manual to see
if there is a menu item to select AT non-stop mode. On the 850, if
this is in the worng state, the tuner will never stop tuning. Just
thinking the 450 may have a similar setting??

What are you trying to tune??????? The internal tuner won't tune your gutter. It was designed to flatten out the SWR on a fairly resonant antenna.

If the internal tuner can not achieve a reasonable SWR in a certain period of time, the radio emits a series of beeps and stops the tuning process. I don't think this is what is happening in his case. One thing I have found is if the carrier level is set too low the tuner will not stop. Also as I mentioned on the 850 there is a menu item that disable the tuner to stop if it achieves a match, i.e. it will just keep tuning until you release the tune button. I do not know if the 450 has this same menu setting but it might be worth a look.

Max

Might be low carrier.
